13 Northbridge IO (NBIO)

13.1 Definitions

Table 225: Link Definitions

Term	Description
IOHC	IOHUB Core; the I/O crossbar.
IOMMU	I/O Memory Management Unit.
NBIF	Northbridge Bus Interface, including PCIe® bridges and controllers for internal endpoints.
NTB	Non-transparent bridge. A device that links the memory space of two separate systems together. The processor implements a NTB that connects two systems together using the PCIe interface.

13.2 IOHUB Core (IOHC)

13.2.1 Definitions

Table 226: Link Definitions

Term	Description
IOHC	IOHUB Core. The I/O crossbar.
MCTP	Management Component Transport Protocol. A manageability protocol that supports communication over a variety of interfaces including PCI Express® and SMBus .
VDM	Vendor Defined Message. A type of PCI Express message that is vendor defined.
P2P	Operations sent directly from one I/O device to another I/O device

13.2.2 Architecture

The IOHC is the I/O crossbar which sits below the Data Fabric. It is responsible for routing requests between the Data Fabric, IOMMU, IOAPIC, [FCH/SCH](#), and multiple PCI Express root ports.

In a multi-node system, there is one IOHC per node which needs to be configured.

13.2.3 Register Access

The majority of IOHC registers are only indirectly accessible from CPU software. Software may use any of the SMN_INDEX/SMN_DATA pairs on the same node as the target IOHC.

13.2.3.1 SMN_INDEX/SMN_DATA

The IOHC provides multiple SMN_INDEX/SMN_DATA pairs within configuration space to provide generic access to [SMN](#) registers on the same node. There are 4 index/data pairs located in the NBCONFIG configuration space (IOHC primary bus number, device 0, function 0) for software to use. Each PCI Express root port configuration space also contains an index/data pair.

The target SMN address is programmed into SMN_INDEX and the target register is accessed using SMN_DATA. This is the assigned mapping of SMN_INDEX/SMN_DATA pairs to software agents:

IOHC::NB_SMN_INDEX_0 / IOHC::NB_SMN_DATA_0: Software application
 IOHC::NB_SMN_INDEX_1 / IOHC::NB_SMN_DATA_1: Reserved for OEM
 IOHC::NB_SMN_INDEX_2 / IOHC::NB_SMN_DATA_2: BIOS (existing usage)
 IOHC::NB_SMN_INDEX_3 / IOHC::NB_SMN_DATA_3: Host System Management Port ([HSMP](#))

13.2.4 Initialization

Many of the IOHC registers needed to control address decoding and transaction routing are standard PCI-PCI bridge registers associated with each of the PCI Express root ports. Standard PCI enumeration routines may be used to initialize these registers. The following sections describe additional proprietary registers which must be programmed prior to PCI enumeration.

13.2.4.1 Configuring Non-PCI Resources

IOHC supports several [MMIO](#) resources which are configured outside of the standard PCI enumeration process. SBIOS must reserve these resources and prevent them from being assigned again during PCI enumeration. Non-PCI MMIO resources within a node must be grouped together and placed adjacent to one of the PCI MMIO ranges assigned to the node. The concatenated range may then be covered by a single Data Fabric MMIO address map entry. In an 8-node system, each instance of IOHC may only be allocated one 32-bit MMIO range and one 48-bit MMIO range within the Data Fabric MMIO address map.

Each base address register contains an enable bit and a lock bit. The lock bit prevents further modifications to the enable and address controls for that resource. Software must set the lock bits after enabling each resource. The IOMMU resource does not have a lock bit but is automatically locked once the address range is enabled. Software must also set the lock bits for all unused resources.

Table 227: IOHC Non-PCI MMIO Resources

Resource	MMIO Control Registers	Size
IOMMU MMIO Registers	IOHMMUL2::IOMMU_CAP_BASE_LO IOHMMUL2::IOMMU_CAP_BASE_HI	512 KB
ASP Public Mailbox	IOHC::PSP_BASE_ADDR_LO IOHC::PSP_BASE_ADDR_HI	1 MB
MP1 Public Mailbox	IOHC::SMU_BASE_ADDR_LO IOHC::SMU_BASE_ADDR_HI	1 MB
SMN MMIO Control Registers	IOHC::FASTREGCNTL_BASE_ADDR_LO IOHC::FASTREGCNTL_BASE_ADDR_HI	4 KB
IOAPIC MMIO Registers	IOHC::IOAPIC_BASE_ADDR_LO IOHC::IOAPIC_BASE_ADDR_HI	256 B
Debug/UMC Registers	IOHC::DBG_BASE_ADDR_LO IOHC::DBG_BASE_ADDR_HI	1 MB
IOMMU VF MMIO Registers	IOHMMUL2::IOMMU_VF_BASE_LO IOHMMUL2::IOMMU_VF_BASE_HI	512 MB
IOMMU VF Control Registers	IOHMMUL2::IOMMU_VFCNTL_BASE_LO IOHMMUL2::IOMMU_VFCNTL_BASE_HI	2 MB
PM_MPDMA MMIO APERTURE	IOHC::FASTREG_BASE_ADDR_LO IOHC::FASTREG_BASE_ADDR_HI	1MB

CCP MMIO APERTURE	IOHC::CCP_BASE_ADDR_LO IOHC::CCP_BASE_ADDR_HI	1 MB
-------------------	--	------

13.2.4.2 PCI Express® Configuration Cycle Hardware Retry on CRS

When issuing configuration cycles on the PCI Express bus, the target may respond with Configuration Request Retry Status (CRS). This typically happens immediately after the link is initialized, or after a reset event such as a hot reset or function-level reset. The following registers should be configured to enable hardware to automatically retry the request. If the target does not respond within the programmed limit, the request is terminated with a DECERR and all-F data.

Note: A PCI Express compliant device must become Configuration-Ready within 1s.

Software may subsequently enable CRS software visibility. This automatically disables the hardware retry feature for reads of the target's Vendor ID.

13.2.4.3 Bridge Device/Function Remapping

The device and function numbers of the PCI Express root complex bridges may be reprogrammed during initialization. This can be done to impact the order of PCI enumeration and resource assignment. Software may only swap device and function numbers between bridges. Bridges should not be allocated a device and function number pair which is not allocated to a bridge at reset.

Within the IOHC and IOAPIC some bridge features are programmed based on the logical bridge number and some are programmed based on the physical bridge number. The logical bridge number is based on the software assigned device and function number for a bridge. The physical bridge number is based on the default device and function number of the bridge.

Table 228: IOHC Logical Bridge Numbering

Bridge Bus Number	Assigned Bridge Device Number	Assigned Bridge Function Number	Logical Bridge Number	PM_PME/HPGPE ID
IOHC Primary bus number	1	1	0	1
	1	2	1	2
	1	3	2	3
	1	4	3	4

	7	2	23	33

The IOHC connects directly to certain clients through physical ports, each with an IOMMU L1. These are enumerated as IOHC crossbar port numbers in the table below. Those clients may further have ports below them, which share a single physical port to the IOHC. These sub-ports are enumerated as IOHC Ingress/Egress port numbers in the table below. Some IOHC features may reference either IOHC Crossbar Port Numbers, or IOHC Ingress/Egress Port numbers, depending on whether the feature applies to a particular physical port of the IOHC or a particular traffic source/destination of the NBIO.

Table 230: IOHC Egress Port Numbers

IOHC Client	Client Port	IOHC Crossbar Port Number	IOHC Ingress/Egress Port Number
-------------	-------------	---------------------------	---------------------------------

SDF	N/A	0	0

Figure 52: IOHC Diagram

All standard PCI bridge configuration space registers are accessed using configuration cycles containing the assigned logical device and function number.

Access to internal per-port [PCIe](#) registers is performed based on the physical bridge number. Access to [RAS](#) related registers is based on the physical bridge number.

13.2.4.4 PCI Express® Vendor Defined Message Support (VDM)

In order to properly support ID-routed VDMs, each instance of IOHC must be programmed with the PCI bus number ranges associated with each node in the system. Each IOHC contains several copies of the IOHC::PCIE_VDM_NODE_CTRL4_n[*:0] register with each copy used to describe the PCI bus range owned by a node. The associated node present bits must be set for each valid bus range.

If IOHC::PCIE_VDM_CNTL2[VdmP2pMode] == 1, then each instance of IOHC must have the node present bit cleared for its own bus range.

13.2.4.5 External MCTP Manager

The processor supports the use of an external [PCIe](#) MCTP manager (Topmost Bus Owner) connected via PCI Express to manage MCTP over PCIe endpoints. Typically this would be integrated as part of an external management controller.

In a system configured for multiple PCIe segments, the processor will act as an MCTP bridge with one bridge port connecting to the PCIe MCTP manager plus one bridge port per PCIe segment configured in the system. As such, the MCTP topology will not necessarily match the PCIe topology. The PCIe MCTP manager will assign an EID to the MCTP bridge, and the MCTP bridge will request a pool of EIDs from the PCIe MCTP manager, which the bridge will assign to the PCIe MCTP endpoints itself. MCTP packets between the endpoints and MCTP manager will be routed through the

internal MCTP bridge using the standard MCTP routing protocol.

In a system configured for a single PCIe segment, the PCIe MCTP manager will send and receive MCTP packets directly to the other MCTP endpoints through the processor root ports without an internal MCTP bridge. In a single PCIe segment topology, the processor supports routing MCTP packets between up to 8 root complexes. If there are more root complexes available than is supported, the IOHC needs to be configured for MCTP multi-segment routing mode, even if only one PCIe segment is configured in the system.

To configure IOHC to use multi-segment MCTP routing, set:

IOHC::PCIE_VDM_CNTL2[MCTPMultiSegEn] = 0x1

The external MCTP manager must be directly connected to one of the processor PCI Express ports. Connection through a PCI Express switch is not supported. Software must identify the segment, bus, device, and function number of the MCTP manager device and program this value into IOHC::PCIE_VDM_CNTL2[MCTPMasterID]. This must be done in each node of the system. Additionally, ID-routed vendor defined messaging must be enabled as described in 13.2.4.4 [PCI Express® Vendor Defined Message Support (VDM)].

Non-standard PCI Express behavior is used to support the external MCTP manager. Specifically, the processor supports receiving MCTP VDMs with the Broadcast-from-RC routing code. The processor broadcasts these out all PCI Express ports on all nodes except the port connected to the MCTP manager. The processor also supporting routing Route-to-RC messages to the external MCTP manager.

The PCIe root port modifies the routing code of messages with RouteToRC message routing code to route incoming MCTP VDM properly to its final destination. This is done for MCTP messages with RouteToRC routing code both in the direction of 1) towards the MCTP manager, or 2) from the MCTP manager. The latter type of conversion is required when the MCTP manager is incapable of sending Broadcast packets to the processor, but sending MCTP VDM with Route-to-RC route code.

1. PCIe root port changes MCTP VDM routing code from Route-to-RC to Broadcast-from-RC in order to forward MCTP VDM from the processor to the MCTP manager. The PCIe root port first identifies the message is a MCTP VDM routing to the MCTP manager by checking,

a. In PCIe VMD message header: Type field([4:0]) is b'10000 or 'Route-to-Root'; Vendor id (bytes 11:10) is MCTP (0x1AB)

b. Valid BDF (Bus, Device, Function Number) registered in the root complex denotes a MCTP end-point,

2. PCIe root complex changes MCTP VMD routing code from Route-to-RC to Broadcast-from-RC to forward MCTP VDM from the MCTP manager to the processor. The PCIe root complex identifies the income message is a MCTP VDM needs to route to the processor by checking,

a. In PCIe VMD message header, Type field([4:0]) is b'10000 or 'Route-to-Root'; Vendor id bytes 11:10 is MCTP (0x1AB4)

b. Valid BDF (Bus, Device, Function Number) registered in the root complex denotes the MCTP manager.

Then the PCIe root complex changes MCTP VDM to a Broadcast-from-RC,

a. Change Type field([4:0]) to b'10011 or Broadcast-from-RC

b. If byte 2 bit7 is 1, recalculate digest ECRC

13.2.4.6 Legacy PM_PME and HotPlugGPE Message to SCH

Legacy PM_PME and HotPlugGPE messages may be sent from the [PCIe](#) root complex bridges to the Server Controller Hub (SCH) to trigger an Server Controller Interrupt (SCI).

13.2.4.7 PME_Turn_Off

Software may send a broadcast PME_Turn_Off message out all [PCIe](#) root ports on a node using the following sequence:

1. IOHC::NB_PCI_ARB[PMETarget] = 0
2. IOHC::NB_PCI_ARB[PMETurnOff] = 0
3. IOHC::NB_PCI_ARB[PMETurnOff] = 1

Software may send a directed PME_Turn_Off message out a specific PCIe root ports on a node using the following sequence:

1. IOHC::NB_PCI_ARB[PMETarget] = Logical Bridge {Device, Function} Number
2. IOHC::NB_PCI_ARB[PMETurnOff] = 0
3. IOHC::NB_PCI_ARB[PMETurnOff] = 1

13.2.5 Peer-to-Peer Support

The processor supports passing high bandwidth peer-to-peer memory read and write operations between I/O devices. Any [PCIe](#) device may be a source or target of a P2P operation. Additionally, internal peripherals such as the CCP or NTB may also be the source or target of a P2P operation.

To generate a peer-to-peer request, an I/O device generates a DMA read or write operation containing an [MMIO](#) address rather than a DRAM address.

13.2.5.1 Peer-to-Peer Synchronization

In order to optimize DMA performance to DRAM, the processor limits the methods peer I/O devices may use to synchronize between each other in order to achieve producer/consumer ordering. These methods are a subset of what is allowed for in the [PCIe](#) specification.

13.2.5.1.1 Peer-to-Peer Status Polling

After issuing a set of P2P write operations, a P2P source may ensure that they are flushed to the target by performing a subsequent P2P read operation to the same target. The P2P source may then signal that the peer writes have been completed by setting an internal status register that is polled by the P2P target.

If the P2P source does not have read permissions to access the target, as enforced by the IOMMU, a zero-byte read operation may still be used.

13.2.5.1.2 Writing Data and Flag to a Peer

After issuing a set of P2P write operations, a P2P source may signal the target that the writes have completed by writing a status flag to the target also using a P2P write with RO=0. The target may either locally poll the status flag or the P2P write may trigger hardware that then operates on the received P2P write data.

13.2.5.1.3 Signaling via the CPU

After issuing a set of P2P write operations, a P2P source may signal the target indirectly via the CPU. It may generate an interrupt or write a flag into DRAM that is polled by the CPU. The CPU would then do an [MMIO](#) write to the P2P target to indicate that the P2P writes have been delivered from the P2P source.

13.2.5.1.4 Unsupported Peer-to-Peer Synchronization Methods

The processor does not support the below peer-to-peer synchronization methods.

Case 1:

Any synchronization scheme that relies on completions pushing posted writes in the downstream direction away from the processor is not supported.

In the following example, the read response of the status register in step 3 may pass the P2P writes in step 1.

1. Device A does P2P writes to device B.
2. Device A sets an internal status register to indicate the P2P writes are complete.
3. In parallel, device B polls the status register in device A.

In order to make the case pass, device A may use a flushing read to device B before setting the internal status register in step 2.

Case 2:

Any synchronization scheme that relies on ordering between the writes of one device and the reads and writes of another device is not supported, regardless of whether or not the operations target DRAM or a 3rd I/O device.

In the following example, it is possible that the DMA operations from device B in step 3 may pass the DMA writes in step 1.

1. Device A does DMA writes to DRAM.
2. Device A does a P2P write to device B to indicate that data has been written to DRAM.
3. Once device B observes the write in step 2, device B does DMA reads or writes to the same DRAM locations accessed by device A and requires that these operations will be ordered after the writes in step 1.

In order to make this case pass, device A should perform a flushing read to DRAM before issuing the P2P write to device B in step 2.

Similarly, for the following example it is possible that the P2P operations in step 3 may reach device C before the P2P writes in step 1.

1. Device A does P2P writes to device C.
2. Device A does a P2P write to device B to indicate that data has been written to device C.
3. Once device B observes the write in step 2, device B does P2P reads or writes to device C to operate on the data sent by device A or otherwise assumes that these operations will be ordered after the writes in step 1.

In order to make this case pass, device A should perform a flushing read to device C before issuing the P2P write to device B in step 2.

13.2.5.2 Peer-to-Peer Interaction with PCIe® ACS

The processor [PCIe](#) root ports treat a received completion that does not match a corresponding non-posted request previously issued by the same root port as an unexpected completion. Configurations that generate non-matching completions to the root ports are not supported. Non-matching completions may be sent to a root port during specific combinations of peer-to-peer traffic in conjunction with an external PCIe switch and specific settings of the PCIe ACS features in the switch. In these cases, completions to peer-to-peer requests do not follow the reverse of the request path back to the requester through the PCIe topology.

Similarly, the processor root ports will trigger a timeout event if the root port issues downstream non-posted request without the corresponding completion returning to the same root port. This can occur whenever PCIe ACS features are enabled such that a function located behind a switch generates a P2P read or atomic targeting an endpoint located behind the same switch, where the request is routed through the PCIe root port, but the completion is directly routed back to the originator without going back through the PCIe root port.

To minimize the number of cases that trigger the above conditions, by default P2P requests issued by the root port have a

RequesterID matching that of the root complex. For most cases, this will force completions to be routed back through the root port if its associated request first came from the root port, even if RO is set in the request.

In general, if IOMMU is enabled, software should enable ACS Request Redirection, enable ACS Upstream Forwarding, and disable ACS Completion Redirection in root ports, external switches and multi-function endpoints to ensure that DMA requests are forced up towards the IOMMU for translation. ACS Direct Translated P2P may be enabled in switches to maximize P2P performance by allowing translated requests and their corresponding completions to be routed directly by the switch without first going up to the processor root port.

13.2.6 Registers

13.2.6.1 IOHC Registers

BXXD00F0x000 (IOHC::NB_VENDOR_ID)

Bits	Description
31:24	Reserved.
23:16	PMETarget . Read-write. Reset: 00h. Directed PME message target select. Only valid during PMEMode 1. Represents {5-bit DEVICE, 3-bit FUNCTION} of intended target of PME_Turn_Off message. Value of 0 means broadcast to all active PCI-Express ports.
15:11	Reserved.
10	PMETOAckStatus . Read-only. Reset: 0. Status of detecting all connected downstream PCI-Express ports return PMETOAck after PME_Turn_Off is sent. This bit is reset when the PMETurnOff register is written.
9	PMETurnOff . Read-write. Reset: 0. Description: PME_Turn_Off message trigger: In case PMEMode is set, write 1 to this bit triggers a PME_Turn_Off messages to all downstream devices. This bit is reset only when the system power is turned off.
8	PMEMode . Read-write. Reset: 1. Description: PME message mode: 0 = PME_Turn_Off message is triggered by a PME_Turn_Off message from the FCH . 1 = PME_Turn_Off is triggered by writing 1 to PMETurnOff bit(0x84[9]).
7:4	Reserved.
3	VGA_HOLE . Read-write. Reset: 1. Description: VGA range decode: 0 = VGA range is decoded as system memory. 1 = VGA range is decoded as MMIO region.
2:0	Reserved.

BXXD00F0x088 (IOHC::NB_DRAM_SLOT1_BASE)

Read-write. Reset: 0000_0000h.

Bits Description

31:28	Reserved.
27:25	SION_Channel_Select. Read-write. Reset: 0h. Description: Selects an SDP channel to measure. 0: OrigData* 1: RdRspData Others: Reserved. *OrigData is measured on the Req channel where ReqCmd[5] is set.
24	SION_Src_Dest_Select. Read-write. Reset: 0. Description: Selects between source and destination interfaces inside the SION. 0: Select source interfaces. 1: Select destination interfaces.
23:16	SION_Index_Select. Read-write. Reset: 00h. Selects SION client by index.
15:1	Reserved.
0	BWCnt_Enable. Read-write. Reset: 0. Enables bandwidth counter.

IOHCBWCNT[0...3]x00000004 (IOHC::IOHC_BWCNT_CNTL_1)

Write-only. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCBWCNT[1:0]x00000004; IOHCBWCNT[1:0]=13[C:B]7_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCBWCNT[3:2]x00000004; IOHCBWCNT[3:2]=13[E:D]7_0000h

Bits	Description
31:2	Reserved.
1	BWCnt_Shadow_Trigger . Write-only. Reset: 0. Program this bit to 1 to trigger a shadow copy on the bandwidth counter. Values inside the bandwidth counter are made visible to register reads via this shadow copy mechanism.
0	BWCnt_Reset_Trigger . Write-only. Reset: 0. Program this bit to 1 to trigger a reset on the bandwidth counter. This zeroes the fields in the bandwidth counter's internal and shadowed states.

IOHCBWCNT[0...3]x00000008 (IOHC::IOHC_BWCNT_CNTL_2)

Read-only. Reset: Fixed,400B_0040h.

_iohub[1:0]_nbio0_aliasSMN; IOHCBWCNT[1:0]x00000008; IOHCBWCNT[1:0]=13[C:B]7_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCBWCNT[3:2]x00000008; IOHCBWCNT[3:2]=13[E:D]7_0000h

Bits	Description
31:24	BWCnt_Counter_Width . Read-only. Reset: Fixed,40h. Indicates the width of counter fields in the bandwidth counter.
23:16	BWCnt_ID_Width . Read-only. Reset: Fixed,0Bh. Indicates the UnitID width that can be matched in the bandwidth counter.
15:0	BWCnt_Num_Counters . Read-only. Reset: Fixed,0040h. Indicates the number of counters, or the number of simultaneous matchable UnitIDs in the bandwidth counter.

IOHCBWCNT[0...3]x0000000C (IOHC::IOHC_BWCNT_CNTL_3)

Read-only. Reset: Fixed,1000_0020h.

_iohub[1:0]_nbio0_aliasSMN; IOHCBWCNT[1:0]x0000000C; IOHCBWCNT[1:0]=13[C:B]7_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCBWCNT[3:2]x0000000C; IOHCBWCNT[3:2]=13[E:D]7_0000h

Bits	Description
31:16	BWCnt_Counter_Start_Offset . Read-only. Reset: Fixed,1000h. Indicates the offset where match counters start from the base address of this space.
15:0	BWCnt_ID_Start_Offset . Read-only. Reset: Fixed,0020h. Indicates the offset where match UnitIDs start from the base address of this space.

IOHCBWCNT[0...3]x00000010 (IOHC::IOHC_BWCNT_TOTAL_LO)

Read-only. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCBWCNT[1:0]x00000010; IOHCBWCNT[1:0]=13[C:B]7_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCBWCNT[3:2]x00000010; IOHCBWCNT[3:2]=13[E:D]7_0000h

Bits	Description
31:0	BWCnt_Total_Lo . Read-only. Reset: 0000_0000h. Lower 32 bits of the bandwidth counter total. This value is updated after a write to IOHC::IOHC_BWCNT_CNTL_1[BWCnt_Shadow_Trigger].

IOHCBWCNT[0...3]x00000014 (IOHC::IOHC_BWCNT_TOTAL_HI)

Read-only. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCBWCNT[1:0]x00000014; IOHCBWCNT[1:0]=13[C:B]7_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCBWCNT[3:2]x00000014; IOHCBWCNT[3:2]=13[E:D]7_0000h

Bits	Description
31:0	BWCnt_Total_Hi . Read-only. Reset: 0000_0000h. Upper 32 bits of the bandwidth counter total. This value is updated after a write to IOHC::IOHC_BWCNT_CNTL_1[BWCnt_Shadow_Trigger].

IOHCBWCNT[0...3]x00000020 (IOHC::IOHC_BWCNT_IDS0)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCBWCNT[1:0]x00000020; IOHCBWCNT[1:0]=13[C:B]7_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCBWCNT[3:2]x00000020; IOHCBWCNT[3:2]=13[E:D]7_0000h

Bits	Description
31	BWCnt_ID1_Vld. Read-write. Reset: 0. Valid bit for the bandwidth counter match-by-ID target field 1. Set this to 1 if this counter should be hit, otherwise if 0, this counter is disabled.
30:27	Reserved.
26:16	BWCnt_ID1. Read-write. Reset: 000h. Bandwidth counter match-by-ID target field 1. Set this to a UnitID value to match and the corresponding valid bit to 1.
15	BWCnt_ID0_Vld. Read-write. Reset: 0. Valid bit for the bandwidth counter match-by-ID target field 0. Set this to 1 if this counter should be hit, otherwise if 0, this counter is disabled.
14:11	Reserved.
10:0	BWCnt_ID0. Read-write. Reset: 000h. Bandwidth counter match-by-ID target field 0. Set this to a UnitID value to match and the corresponding valid bit to 1.

IOHCBWCNT[0...3]x00000024 (IOHC::IOHC_BWCNT_IDS1)

Read-write. Reset: 0000_0000h.

Bits	Description
31:24	APIC_Range. Read-write. Reset: 00h. This field sets the bits 19:12 of the bridge APIC range.
23	APIC_Enable. Read-write. Reset: 0. This field sets to enable the bridge APIC range decoding. Requests fall in the bridge APIC range if addr[39:12]={20'h00_FEC,APIC_Range[7:0]}.
22	Reserved.
21	DisableDMAP2PChain. Read-write. Reset: 0. Override ReqChain to 0 for DMA/P2P requests. Messages are not affected.
20	Reserved.
19	ForceBlockLevelPort. Read-write. Reset: 0. Override ReqBlockLevel to Port.
18	CrsEnable. Read-write. Reset: 0. This field sets to enable the hardware retry on receiving configuration request retry status.
17:13	Reserved.
12	SwitchP_En. Read-write. Reset: 1. This field sets to enable NP write to P conversion to the bridge.
11:10	IDOMode. Read-write. Reset: 0h. Description: Override IDO ordering: 00 - IDO attributes are passed from the client without modification 01 - IDO is disabled. ReqBlockLevel is downgraded from Stream to Unit 10 - IDO forced on. ReqBlockLevel is upgraded from Unit to Stream 11 - Reserved.
9	ForceRspPassPw. Read-write. Reset: 0. Force RspPassPW=1 on DMA non-posted requests.
8	NoSnoopDis. Read-write. Reset: 0. Disable non-coherent DMA requests. These are converted into their equivalent coherent form/command.
7	PassPWDis. Read-write. Reset: 0. Disable PassPW/RelaxedOrdering on DMA requests.
6	MaskUR_Enable. Read-write. Reset: 0. The field sets to enable masking a host completion UR status to Success status when return to CPU.
5:3	Reserved.
2	CfgDis. Read-write. Reset: 0. Description: This field sets to disable onboard/internal configuration access to the bridge. Non-SB bridges are not expected to set this bit.
1	BusMasterDis. Read-write. Reset: 0. Description: (Debug bit) This field sets to disable the bridge's ability to operate as a master. It overrides the Bus Master Enable bit in the bridge when this bit is set.
0	BridgeDis. Read-write. Reset: 0. Description: This field sets to hide the bridge. No accesses are allowed to go to the bridge when this bit is set.

Bits	Description
------	-------------

31:0	SCRATCH_1. Read-write. Reset: 0000_0000h. Scratch bits.
------	--

IOHCFASTREG[0...3]x00000000 (IOHC::FASTREG_APERTURE)

Read-write. Reset: 0000_0000h.

FastRegs [MMIO](#) limit address

_iohub[1:0]_nbio0_aliasSMN; IOHCFASTREG[1:0]x00000000; IOHCFASTREG[1:0]=13[C:B]0_7000h

_iohub[1:0]_nbio1_aliasSMN; IOHCFASTREG[3:2]x00000000; IOHCFASTREG[3:2]=13[E:D]0_7000h

Bits	Description
------	-------------

31	FASTREG_TRAN_POSTED. Read-write. Reset: 0. Set SMN transaction to be posted type when accessing the lower 1M of the FastRegs MMIO range.
----	---

30:20	Reserved.
-------	-----------

19:16	FASTREG_NODE_ID. Read-write. Reset: 0h. SMN ApertureID extension used when accessing the lower 1M of the FastRegs MMIO range.
-------	--

15:12	Reserved.
-------	-----------

11:0	FASTREG_APERTURE_ID. Read-write. Reset: 000h. SMN ApertureID used when accessing the lower 1M of the FastRegs MMIO range.
------	--

IOHCINDCFG[0...3]x000000F0 (IOHC::IOMMU_SMN_INDEX_0)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCINDCFG[1:0]x000000F0; IOHCINDCFG[1:0]=13[C:B]7_D000h

_iohub[1:0]_nbio1_aliasSMN; IOHCINDCFG[3:2]x000000F0; IOHCINDCFG[3:2]=13[E:D]7_D000h

Bits	Description
------	-------------

31:0	IOMMU_SMN_INDEX_0. Read-write. Reset: 0000_0000h. Index register field for the Index/Data pair 0 to access IOMMU registers indirectly.
------	---

IOHCINDCFG[0...3]x000000F4 (IOHC::IOMMU_SMN_DATA_0)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCINDCFG[1:0]x000000F4; IOHCINDCFG[1:0]=13[C:B]7_D000h

_iohub[1:0]_nbio1_aliasSMN; IOHCINDCFG[3:2]x000000F4; IOHCINDCFG[3:2]=13[E:D]7_D000h

Bits	Description
31:0	IOMMU_SMN_DATA_0. Read-write. Reset: 0000_0000h. Data register field for the Index/Data pair 0 to access IOMMU registers indirectly.

IOHCINDCFG[0...3]x000000F8 (IOHC::IOMMU_SMN_INDEX_1)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCINDCFG[1:0]x000000F8; IOHCINDCFG[1:0]=13[C:B]7_D000h

_iohub[1:0]_nbio1_aliasSMN; IOHCINDCFG[3:2]x000000F8; IOHCINDCFG[3:2]=13[E:D]7_D000h

Bits	Description
31:0	IOMMU_SMN_INDEX_1. Read-write. Reset: 0000_0000h. Index register field for the Index/Data pair 1 to access IOMMU registers indirectly.

IOHCINDCFG[0...3]x000000FC (IOHC::IOMMU_SMN_DATA_1)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCINDCFG[1:0]x000000FC; IOHCINDCFG[1:0]=13[C:B]7_D000h

_iohub[1:0]_nbio1_aliasSMN; IOHCINDCFG[3:2]x000000FC; IOHCINDCFG[3:2]=13[E:D]7_D000h

Bits	Description
31:0	IOMMU_SMN_DATA_1. Read-write. Reset: 0000_0000h. Data register field for the Index/Data pair 1 to access IOMMU registers indirectly.

IOHCINDCFG[0...3]x00000100 (IOHC::IOAPIC_MIO_INDEX)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCINDCFG[1:0]x00000100; IOHCINDCFG[1:0]=13[C:B]7_D000h

_iohub[1:0]_nbio1_aliasSMN; IOHCINDCFG[3:2]x00000100; IOHCINDCFG[3:2]=13[E:D]7_D000h

Bits	Description
31:0	IOAPIC_MIO_INDEX_data. Read-write. Reset: 0000_0000h. Index register field for the Index/Data pair to access IOAPIC MMIO registers indirectly.

IOHCINDCFG[0...3]x00000110 (IOHC::IOAPIC_MIO_DATA)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCINDCFG[1:0]x00000110; IOHCINDCFG[1:0]=13[C:B]7_D000h

_iohub[1:0]_nbio1_aliasSMN; IOHCINDCFG[3:2]x00000110; IOHCINDCFG[3:2]=13[E:D]7_D000h

Bits	Description
31:0	IOAPIC_MIO_DATA. Read-write. Reset: 0000_0000h. Data register field for the Index/Data pair to access IOAPIC MMIO registers indirectly.

IOHCMISC[0...3]x00000000 (IOHC::NB_CNTL)

Read-write. Reset: 0000_0000h.

Northbridge Control Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000000; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000000; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:8	Reserved.
7	HWINIT_WR_LOCK. Read-write. Reset: 0. 0=Disable. 1=Enable. Description: Lock HWInit registers. This bit prevents updates to the IOHC shadow copies of the BIF core configuration registers locked by C_PCIEIND:0x1010010[0].
6:0	Reserved.

IOHCMISC[0...3]x00000014 (IOHC::NB_REVID)

Read-only.

GNB Revision ID.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00000014; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00000014; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:10	Reserved.
9:0	REVISION_ID . Read-only. FUSE controlled (NB_REV_ID) read-only revision ID.

IOHCMISC[0...3]x0000001C (IOHC::IOHC_STATUS)

Read-only.

internal iohc status register.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x0000001C; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x0000001C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:2	Reserved.
1	IOHC_NBIO_lclk_ctrl . Read-only. LCLK deep sleep control bit.
0	iohc_total_idle . Read-only. status bit is asserted when iohc is disconnected to all surrounding interface, only excluding RSMU slave register interface.

IOHCMISC[0...3]x00000020 (IOHC::IOHC_REFCLK_MODE)

Read-write. Reset: 0000_0002h.

[REFCLK](#) frequency mode[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00000020; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00000020; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:3	Reserved.
2	MODE_27MHZ . Read-write. Reset: 0. Init: BIOS,0. REFCLK is running at 27 MHZ
1	MODE_25MHZ . Read-write. Reset: 1. Init: BIOS,0. REFCLK is running at 25 MHZ
0	MODE_100MHZ . Read-write. Reset: 0. Init: BIOS,1. REFCLK is running at 100 MHZ

IOHCMISC[0...3]x00000024 (IOHC::NBIO_LCLK_DS_MASK)

Read-write. Reset: 0000_0000h.

NBIO LCLK deep sleep mask.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00000024; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00000024; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	LCLK_DS_MASK . Read-write. Reset: 0000_0000h. Description: 1. NBIO_LCLK_DS_MASK[x] is set to 1, DS sleep status will be passed by; 2. NBIO_LCLK_DS_MASK[x] is set to 0, using real input deep sleep status. Please note that the left side of / is represent iohub0, the right represent iohub1. [0]->SST_NBIO/reserved; [1]->SST_FCH/reserved; [2]->PCIE0/PCIE2; [3]->PCIE1/PCIE3; [4]->NBIF0/1; [5]->reserved/NBIF1; [6]->NBIF2/reserved; [7]->NTB/NTB; [8]->PCIE2/reserved; [9]->L2IMU/L2IMU; [10]->IOHC/IOHC; [11]->SDPMUX/reserved; [12]->IOAGR/IOAGR; [13]->IOAPIC/IOAPIC; [14]->L1IOAGR/L1IOAGR; [15]->L1PCIE0/L1PCIE2; [16]->L1PCIE1/L1PCIE3; [17]->reserved/reserved 3. NBIO_LCLK_DS_MASK[31:18] are reserved

IOHCMISC[0...3]x00000028 (IOHC::IOHC_PCIE_CRIS_Count)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000028; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000028; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:28	Reserved.
27:16	CrsLimitCount. Read-write. Reset: 000h. Description: Sets the length of time which IOHC can issue retries for the same configuration cycle. Values are specified in ~1.6ms(1638400ns) granularity.
15:0	CrsDelayCount. Read-write. Reset: 0000h. Init: BIOS,0006h. Description: Sets the length of time which IOHC waits between resending the configuration cycle. Values are specified in 1.6us (1600ns) granularity.

IOHCMISC[0...3]x00000030 (IOHC::IOHC_P2P_CNTL)

Read-write. Reset: 0000_0000h.

IOHC Bridge Control.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000030; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000030; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:12	Reserved.
11	DLDownResetEn. Read-write. Reset: 0. Description: Reset on DLDown. 1=DLDown reset all IOHC PCIE/NBIF shadowed configuration registers.
10:0	Reserved.

IOHCMISC[0...3]x00000034 (IOHC::CFG_IOHC_PCI)

IOHC PCI Configuration.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000034; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000034; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31	IOMMU_DIS. Read-only. FUSE controlled IOMMU Disable readback.
30:1	Reserved.
0	CFG_IOHC_PCI_Dev0Fn2RegEn. Read-write. Reset: 1. Enables configuration accesses to Dev0 Fun2 (Used by IOMMU).

IOHCMISC[0...3]x00000044 (IOHC::NB_BUS_NUM_CNTL)

Read-write. Reset: 0000_0000h.

GNB Bus Number Control.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000044; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000044; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:24	Reserved.
23:16	NB_SEGMENT. Read-write. Reset: 00h. Specifies the number of the NBIO segment in a multi-segmented system.
15:9	Reserved.
8	NB_BUS_LAT_Mode. Read-write. Reset: 0. Description: NBIO bus number is specified by NB_BUS_NUM. 0 = Local bus number of NBIO is capture from any type 0 configuration request. 1= Use the NB_BUS_NUM to decode for configuration cycles targeting the NBIO bus.
7:0	NB_BUS_NUM. Read-write. Reset: 00h. Specifies the number of the NBIO local bus when NB_BUS_LAT_mode is set.

IOHCMISC[0...3]x00000058 (IOHC::IOHC_AER_CNTL)

Read-write. Reset: 0000_0000h.

IOHC Advanced Error Reporting Control.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000058; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000058; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:2	Reserved.
1	CFG_IOHC_AER_COMPLIANCE_EN . Read-write. Reset: 0. When AER is enabled, log all errors in AER. This may result in double-logging of some error types. When set, responses from SDF to PCIE/NBIF have the AERlog bit set.
0	Reserved.

IOHCMISC[0...3]x0000005C (IOHC::NB_MMIOBASE)

Read-write. Reset: 0000_0000h.

Memory Mapped IO Base Address.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000005C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000005C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	MMIOBASE . Read-write. Reset: 0000_0000h. Memory mapped IO base address [47:16].

IOHCMISC[0...3]x00000060 (IOHC::NB_MMIOLIMIT)

Read-write. Reset: 0000_0000h.

Memory Mapped IO Limit Address.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000060; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000060; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	MMIOLIMIT . Read-write. Reset: 0000_0000h. Memory mapped IO limit address [47:16].

IOHCMISC[0...3]x00000064 (IOHC::NB_LOWER_TOP_OF_DRAM2)

Read-write. Reset: 0000_0000h.

Top of Memory 2 Low.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000064; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000064; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:23	LOWER_TOM2 . Read-write. Reset: 000h. TOM2 [31:23] - This field specifies the maximum system address for upstream read and write transactions that are forwarded to the host bridge (from the GNB to the CNB). All addresses less than this system address are forwarded to DRAM and are not checked to determine if the transaction is a peer-to-peer transaction. All upstream reads with addresses greater than this system address are master aborted.
22:1	Reserved.
0	ENABLE . Read-write. Reset: 0. TOM2 enabled.

IOHCMISC[0...3]x00000068 (IOHC::NB_UPPER_TOP_OF_DRAM2)

Read-write. Reset: 0000_0000h.

Top of Memory 2 High.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000068; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000068; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:9	Reserved.
8:0	UPPER_TOM2 . Read-write. Reset: 000h. TOM2 [40:32]. See IOHC::NB_LOWER_TOP_OF_DRAM2.

IOHCMISC[0...3]x0000006C (IOHC::NB_LOWER_DRAM2_BASE)

Read-write. Reset: 0000_0000h.

Memory 2 Base Low

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000006C; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000006C; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:23	LOWER_DRAM2_BASE. Read-write. Reset: 000h. 4GB) for upstream read and write transactions that are forwarded to the host bridge (from the GNB to the CNB). All addresses less than this system address are forwarded to DRAM and are not checked to determine if the transaction is a peer-to-peer transaction. All upstream reads with addresses greater than this system address are master aborted.
22:0	Reserved.

IOHCMISC[0...3]x00000070 (IOHC::NB_UPPER_DRAM2_BASE)

Read-write. Reset: 0000_0001h.

Memory 2 Base High

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000070; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000070; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:9	Reserved.
8:0	UPPER_DRAM2_BASE. Read-write. Reset: 001h. 4GB for upstream read and write transactions that are forwarded to the host bridge (from the GNB to the CNB). All addresses less than this system address are forwarded to DRAM and are not checked to determine if the transaction is a peer-to-peer transaction. All upstream reads with addresses greater than this system address are master aborted.

IOHCMISC[0...3]x0000007C (IOHC::SB_LOCATION)

Read-write. Reset: Cold,0004_0001h.

South Bridge Location Register. Register set 0 indicates the GNB is secondary and there is no SB/[FCH](#) connected.`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000007C; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000007C; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:16	SBlocated_Core. Read-write. Reset: Cold,0004h. Description: SB/ FCH Core Location. One hot encoding register: 0x1 - FCH resides under PCIE/NBIF/iFCH core0 0x2 - FCH resides under PCIE/NBIF/iFCH core1 0x4 - FCH resides under PCIE/NBIF/iFCH core2 0x8 - FCH resides under PCIE/NBIF/iFCH core3 etc...
15:0	SBlocated_Port. Read-write. Reset: Cold,0001h. Description: SB/ FCH Port Location. One hot encoding register: 0x1 - FCH located on port0 of SBlocated_Core 0x2 - FCH located on port1 of SBlocated_Core 0x4 - FCH located on port2 of SBlocated_Core 0x8 - FCH located on port3 of SBlocated_Core etc...

IOHCMISC[0...3]x00000080 (IOHC::SW_US_LOCATION)

Read-write. Reset: Cold,0001_0001h.

Switch Upstream Location Register. Register set 0 indicates there is no SWUS connected.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000080; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000080; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:16	SW_USlocated_Core. Read-write. Reset: Cold,0001h. Description: <RWS> SW_US Core Location. One hot encoding register: 0x1 - SW_US resides under PCIE/NBIF/iFCH core0 0x2 - SW_US resides under PCIE/NBIF/iFCH core1 0x4 - SW_US resides under PCIE/NBIF/iFCH core2 0x8 - SW_US resides under PCIE/NBIF/iFCH core3 etc...
15:0	SW_USlocated_Port. Read-write. Reset: Cold,0001h. Description: <RWS> SW_US Port Location. One hot encoding register: 0x1 - SW_US located on port0 of SW_USlocated_Core 0x2 - SW_US located on port1 of SW_USlocated_Core 0x4 - SW_US located on port2 of SW_USlocated_Core 0x8 - SW_US located on port3 of SW_USlocated_Core etc...

IOHCMISC[0...3]x00000088 (IOHC::IOHC_GLUE.CG_LCLK_CTRL_0)

Read-write. Reset: FFC0_0100h.

IHOC LCLK Clock Gating Control 0.

IOHCMISC[0...3]x00000108 (IOHC::SW_NMI_CNTL)

Read-write. Reset: 0000_0000h.

Software Requesting NMI interrupt register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000108; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000108; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	SW_NMI_Status. Read-write. Reset: 0000_0000h. Description: Software NMI Status. Software uses these bits to indicate the reasoning for issuing NMI. Writing 1 to bit[x] inverts the value of bit[x].

IOHCMISC[0...3]x0000010C (IOHC::SW_SMI_CNTL)

Read-write. Reset: 0000_0000h.

Software Requesting [SMI](#) interrupt register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000010C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000010C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	SW_SMI_Status. Read-write. Reset: 0000_0000h. Description: Software SMI Status. Software uses these bits to indicate the reasoning for issuing SMI. Writing 1 to bit[x] inverts the value of bit[x].

IOHCMISC[0...3]x00000110 (IOHC::SW_SCI_CNTL)

Read-write. Reset: 0000_0000h.

Software Requesting SCI interrupt register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000110; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000110; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	SW_SCI_Status. Read-write. Reset: 0000_0000h. Description: Software SCI Status. Software uses these bits to indicate the reasoning for issuing SCI. Writing 1 to bit[x] inverts the value of bit[x].

IOHCMISC[0...3]x00000114 (IOHC::APML_SW_STATUS)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

[APML](#) TRIGGER Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000114; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000114; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:1	Reserved.
0	APML_NMI_STATUS. Read,Write-1-to-clear. Reset: Cold,0. status indicates NMI is generated from APML .

IOHCMISC[0...3]x00000118 (IOHC::IOHC_FEATURE_CNTL)

Read-write. Reset: 0000_0003h.

Control bits for misc IOHC features.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000118; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000118; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:23	Reserved.
22	IOHC_ARI_SUPPORTED. Read-write. Reset: 0. Enables the per-port ARI_EN signals from the IOHC shadow registers. This is used for decoding external configuration requests to the bridges.
21:3	Reserved.
2:1	P2P_mode. Read-write. Reset: 1h. Description: Peer to peer mode: 00 - Mode 0 : DMA writes not matching a valid P2P range are dropped (Legacy operation) 01 - Mode 1 : DMA writes not matching a valid P2P range are forwarded to the DF 10 - Mode 2 : all DMA writes are forwarded to the DF 11 - Mode 3: Disable P2P
0	HpPmpme_DevID_En. Read-write. Reset: 1. Indicate message-generating bridge VDM ID in the ReqID bit[7:4] of the HP or PMPME message to the SB.

IOHCMISC[0...3]x00000120 (IOHC::IOHC_INTERRUPT_EOI)

Write-only. Reset: 0000_0000h.

End of Interrupt Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000120; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000120; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:3	Reserved.
2	NMI_EOI. Write-only. Reset: 0. Indicate interrupt handler exited the NMI interrupt routine.
1	SCI_EOI. Write-only. Reset: 0. Indicate interrupt handler exited the SCI interrupt routine.
0	SMI_EOI. Write-only. Reset: 0. Indicate interrupt handler exited the SMI interrupt routine.

IOHCMISC[0...3]x00000124 (IOHC::SW_SYNCFLOOD_CNTL)

Read-write. Reset: 0000_0000h.

SW trigger SYNCFLOOD.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000124; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000124; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:2	Reserved.
1	SW_SYNCFLOOD_APLM. Read-write. Reset: 0. This register is not intended to be used by CPU SW. It is provisioned for PSP or SMU to trigger Syncflood on the SDP interfaces. For example, this allows an interface to be created where an APML command processed by SMU triggers a syncflood. When this register is written, status is set in SyncfloodFromAPML.
0	SW_SYNCFLOOD_PRIVATE. Read-write. Reset: 0. This register is not intended to be used by CPU SW. It is provisioned for PSP or SMU to trigger Syncflood on the SDP interfaces. For example, this allows an interface to be created where an APML command processed by SMU triggers a syncflood. When this register is written, no status is set in the RAS registers. The reason for triggering the syncflood may be manually stored in a FW-defined location.

IOHCMISC[0...3]x00000128 (IOHC::IOHC_PIN_CNTL)

Read-write. Reset: 0000_0000h.

IOHC Pin control register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000128; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000128; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:1	Reserved.
0	NMI_SYNCFLOOD_PIN_MODE. Read-write. Reset: 0. Description: Select the mode of the NMI_Syncflood Combo Pin. 0 - Pin as SYNCFLOOD_L. 1 - Pin as NMI#.

IOHCMISC[0...3]x0000012C (IOHC::IOHC_INTR_CNTL)

Read-write. Reset: 0000_FF00h.

IOHC Interrupt Control Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000012C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000012C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	Reserved.
15:8	NMI_DEST_ctrl. Read-write. Reset: FFh. Program the destination field for all NMI interrupts generated by IOHC.
7:0	Reserved.

IOHCMISC[0...3]x00000130 (IOHC::IOHC_FEATURE_CNTL2)

Reset: Cold,0000_0000h.

Control bits for misc IOHC features.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000130; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000130; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:19	Reserved.
18	NP_DMA_DROPPED. Read,Write-1-to-clear. Reset: Cold,0. Description: DMA non-posted request dropped status. Set when a non-posted DMA is dropped in IOHC.
17	P_DMA_DROPPED. Read,Write-1-to-clear. Reset: Cold,0. Description: DMA posted request dropped status. Set when a posted DMA is dropped inside IOHC.
16	CrsStatus. Read,Write-1-to-clear. Reset: Cold,0. Status indicating a Configuration Retry Status is detected.
15:2	Reserved.
1	SErr_status. Read-only. Reset: Cold,0. Indicates IOHUB generated a system error.
0	NMI_status. Read,Write-1-to-clear. Reset: Cold,0. Indicates an NMI interrupt has been sent to SDF.

IOHCMISC[0...3]x00000138 (IOHC::NB_TOP_OF_DRAM3)

Read-write. Reset: 0000_0000h.

Top of Memory 3.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00000138; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00000138; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31	TOM3_ENABLE . Read-write. Reset: 0. Enable TOM3 for memory space decoding.
30	Reserved.
29:0	TOM3_LIMIT . Read-write. Reset: 0000_0000h. Description: TOM3 defines the top of physical memory between 40-bit and 52-bit space inclusive. The register contains bit 51:22. Lower address bits are implicitly set to 1.

IOHCMISC[0...3]x00000148 (IOHC::CAM_CONTROL)

Read-write. Reset: 0000_0000h.

Control for Configuration Access Monitor (CAM).

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00000148; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00000148; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:12	Reserved.
11:8	CrossTrigger . Read-write. Reset: 0h. Specifies which CrossTrigger bit(s) to use to notify the DFD block of any CAM detected requests. More than one bit may be set.
7	Reserved.
6:4	VC . Read-write. Reset: 0h. Virtual-Channel (VC) of access. Valid values are 0x0 (NP) and 0x1 (P)
3	DataMatchEn . Read-write. Reset: 0. Enable/disable data matching (for writes only)
2	AccessType . Read-write. Reset: 0. Type of access. 0 direct, 1 indirect.
1	Op . Read-write. Reset: 0. Operation of target Access. 0 read, 1 write.
0	CAM_En . Read-write. Reset: 0. Enable/disable CAM feature.

IOHCMISC[0...3]x0000014C (IOHC::CAM_TARGET_INDEX_ADDR_BOTTOM)

Read-write. Reset: 0000_0000h.

BOTTOM 32 bits of Target access index address.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x0000014C; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x0000014C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	IndexAddrBottom . Read-write. Reset: 0000_0000h. Bits [31:0] of the target access index address in HT ExtCfg/IO/ MMIO format.

IOHCMISC[0...3]x00000150 (IOHC::CAM_TARGET_INDEX_ADDR_TOP)

Read-write. Reset: 0000_0000h.

TOP 32 bits of Target access index address.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00000150; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00000150; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	IndexAddrTop . Read-write. Reset: 0000_0000h. Bits [63:32] of the target access index address in HT ExtCfg/IO/ MMIO format.

IOHCMISC[0...3]x00000154 (IOHC::CAM_TARGET_INDEX_DATA)

Read-write. Reset: 0000_0000h.

Target access index data value.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000154; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000154; IOHCMISC[3:2]=13[E:D]1_0000h`**Bits Description**31:0 **IndexData**. Read-write. Reset: 0000_0000h. Target access index data value.**IOHCMISC[0...3]x00000158 (IOHC::CAM_TARGET_INDEX_DATA_MASK)**

Read-write. Reset: 0000_0000h.

Mask for target access index data.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000158; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000158; IOHCMISC[3:2]=13[E:D]1_0000h`**Bits Description**31:0 **IndexDataMask**. Read-write. Reset: 0000_0000h. Mask for target access index data. When a bit is set to 1, the corresponding bit of the index data is valid.**IOHCMISC[0...3]x0000015C (IOHC::CAM_TARGET_DATA_ADDR_BOTTOM)**

Read-write. Reset: 0000_0000h.

BOTTOM 32 bits of Target access data address.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000015C; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000015C; IOHCMISC[3:2]=13[E:D]1_0000h`**Bits Description**31:0 **DataAddrBottom**. IOHCMISC0x00000190...IOHCMISC3x00000200 (IOHC::PCIE_VDM_NODE_CTRL4)

Read-write. Reset: 0000_0000h.

PCIE VDM controls.

_iohub0_n[7:0]_nbio0_aliasSMN; IOHCMISC0x0000_0[20:19]0; IOHCMISC0=13B1_0000h_iohub1_n[7:0]_nbio0_aliasSMN; IOHCMISC1x0000_0[20:19]0; IOHCMISC1=13C1_0000h_iohub0_n[7:0]_nbio1_aliasSMN; IOHCMISC2x0000_0[20:19]0; IOHCMISC2=13D1_0000h_iohub1_n[7:0]_nbio1_aliasSMN; IOHCMISC3x0000_0[20:19]0; IOHCMISC3=13E1_0000h

Bits	Description
31	NODE_PRESENT. Read-write. Reset: 0. Indicate Node is in the system, and all values programmed in PCIE_VDM_NODE_CTRL0-4 are valid.
30:16	Reserved.
15:8	BUS_RANGE_LIMIT. Read-write. Reset: 00h. The highest bus number residing below NBIO node.
7:0	BUS_RANGE_BASE. Read-write. Reset: 00h. The lowest bus number residing below NBIO node.

IOHCMISC[0...3]x00000230 (IOHC::PCIE_VDM_CNTL2)

Read-write. Reset: 0000_0000h.

PCIE VDM / MCTP VDM control register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000230; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000230; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	MCTPMasterID. Read-write. Reset: 0000h. Indicates the Bus, Device, Function number of the MCTPMaster. An all-0s value indicates no MCTPMaster is present.
15:8	MCTPMasterSeg. Read-write. Reset: 00h. Indicates the Segment number of the MCTPMaster. This value is used if MCTPMultiSegEn is 1.
7	RouteAllToMCTPMaster. Read-write. Reset: 0. Route all MCTP requests going through the logical MCTP bridge to the MCTPMaster.
6	OtherVDM2SMUEn. Read-write. Reset: 0. Enables non-MCTP/non-APMTP VDM requests to be sent to SMU. This is currently unused.
5	AMDVDM2SMUEn. Read-write. Reset: 0. Enables AMD VDM requests to be sent to SMU. This is currently unused.
4	MCTPT2SMUEn. Read-write. Reset: 0. Enables MCTP VDM requests to be sent to SMU. This is currently unused.
3	MCTPMultiSegEn. Read-write. Reset: 0. Enables MCTP VDM multi segment support. Enables forwarding MCTP VDMs to MPIO .
2	MCTPEndpointEn. Read-write. Reset: 0. Enables MCTP VDM Endpoint support. Enables subdecode MCTP VDMs to MPIO .
1:0	VdmP2pMode. Read-write. Reset: 0h. This register controls the routing of ID-routed vendor defined messages 0 - Local VDM P2P only 1 - Local VDM P2P + Remote VDM P2P 2 - Remote P2P only. VDMs to local targets are reflected off the Data Fabric. 3 - VDM ID-routing is disabled. All ID-routed VDMs are terminated.

IOHCMISC[0...3]x00000234 (IOHC::PCIE_VDM_CNTL3)

Read-write. Reset: 0000_0000h.

PCIE APMTP VDM control register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000234; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000234; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	APMTPMasterID. Read-write. Reset: 0000h. Indicates the Bus, Device, Function number of the APMTP master.
15	APMTPMasterValid. Read-write. Reset: 0. Indicates whether the contents of APMTPMasterID are valid.
14:0	Reserved.

IOHCMISC0x00000240...IOHCMISC3x00000288 (IOHC::STALL_CONTROL_XBARPORT_REQEN)

Read-write. Reset: 0000_0000h.

_iohub0_n[6:0]_nbio0_aliasSMN; IOHCMISC0x0000_02[88,7C,70,64,58,4C,40]; IOHCMISC0=13B1_0000h

Bits	Description
31:16	Reserved.
15:0	MPIO_BASE_ADDR_HI . Read-write. Reset: 0000h. MPIO private MMIO base address bits 47:32.

IOHCMISC[0...3]x00000318 (IOHC::SMMU_BASE_ADDR_LO)

Read-write. Reset: 0000_0000h.

SMMU [MMIO](#) base address.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00000318; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00000318; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:19	SMMU_BASE_ADDR_LO . Read-write. Reset: 0000h. SMMU MMIO base address bits 31:19, IOHC decodes to 512K.
18:2	Reserved.
1	SMMU_MMIO_LOCK . Read-write. Reset: 0. Locks the SMMU MMIO address range and enable until the next warm reset.
0	SMMU_MMIO_EN . Read-write. Reset: 0. SMMU MMIO enable.

IOHCMISC[0...3]x0000031C (IOHC::SMMU_BASE_ADDR_HI)

Read-write. Reset: 0000_0000h.

SMMU [MMIO](#) base address.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x0000031C; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x0000031C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	Reserved.
15:0	SMMU_BASE_ADDR_HI . Read-write. Reset: 0000h. SMMU MMIO base address bits 47:32.

IOHCMISC[0...3]x00000340 (IOHC::IOHC_PGMST_CNTL)

Read-write. Reset: 0000_000Fh.

power gate control register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000340; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000340; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	Reserved.
15:14	CFG_FW_PG_EXIT_EN. Read-write. Reset: 0h. 2'x1: enable sending the pwrmgr_int for FW interlock feature, 2'b1x: Enable wakeup tile from power gated state using the pwrmtg_int_clear signal
13:10	CFG_IDLENESS_COUNT_EN. Read-write. Reset: 0h. 0: idleness_counter is disabled, PGMST uses only hysteresis timeout value to enter power gating. Cfg_idleness_count_en > 0: If the internal idleness counter >= Cfg_idleness_count_en, enter power gated state as soon PGSLV becomes idle, without waiting for the hysteresis timeout.
9	Reserved.
8	CFG_PG_EN. Read-write. Reset: 0. enables dynamic power gating
7:0	CFG_PG_HYSTERESIS. Read-write. Reset: 0Fh. controls the number of consecutive periods when all PG IPs assert PGMST_PGSLV_pwrGate_ready before initiating power gating. Each period is 1600ns duration

IOHCMISC[0...3]x00000344 (IOHC::IOHC_SDP_PORT_CONTROL)

Read-write. Reset: 000C_8010h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000344; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000344; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:28	Reserved.
27:20	IOS_Port_Disconnect_Real_Time_Hysteresis. Read-write. Reset: 00h. Hysteresis timer to deassert SDP ClkReq to IOS when block is idle.
19:12	IOM_Port_Disconnect_Real_Time_Hysteresis. Read-write. Reset: C8h. Hysteresis timer to deassert SDP ClkReq to IOM when block is idle. Count in real time(every 200ns).
11:0	Port_Disconnect_Hysteresis. Read-write. Reset: 010h. <RW> Hysteresis timer to deassert SDP ClkReq when block is idle.

IOHCMISC[0...3]x0000034C (IOHC::IOHC_SDP_PARITY_CONTROL)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000034C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000034C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:1	Reserved.
0	SDP_ParityDis. Read-write. Reset: 0. Disable parity error check for IOHC internally consumed data.

IOHCMISC[0...3]x00000350 (IOHC::IOHC_PGSLV_CNTL)

Read-write. Reset: 0000_0004h.

power gate control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000350; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000350; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:5	Reserved.
4:0	CFG_IDLE_HYSTERESIS. Read-write. Reset: 04h. Hysteresis timer to enter power gating. The counter decrements every 200ns

IOHCMISC[0...3]x00000354 (IOHC::IOHC_RSMU_HCID)

Read-write. Reset: 0002_0000h.

RSMU hardware revision register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000354; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000354; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:23	Reserved.
22:16	RSMU_HCID_HwMajVer. Read-write. Reset: 02h. RSMU hardware major revision.
15	Reserved.
14:8	RSMU_HCID_HwMinVer. Read-write. Reset: 00h. RSMU hardware minor revision.
7:6	Reserved.
5:0	RSMU_HCID_HwRev. Read-write. Reset: 00h. RSMU hardware revision.

IOHCMISC[0...3]x00000358 (IOHC::IOHC_RSMU_SIID)

Read-write. Reset: 0002_0000h.

RSMU software revision register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000358; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000358; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:23	Reserved.
22:16	RSMU_SIID_SwIfMajVer. Read-write. Reset: 02h. RSMU software major revision.
15	Reserved.
14:8	RSMU_SIID_SwIfMinVer. Read-write. Reset: 00h. RSMU software minor revision.
7:6	Reserved.
5:0	RSMU_SIID_SwIfRev. Read-write. Reset: 00h. RSMU software revision.

IOHCMISC[0...3]x0000035C (IOHC::IOHC_HST_ORIG_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000035C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000035C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	HST_EnableEarlyOrigClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early OrigClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	HST_EnableEarlyOrigClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early OrigClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOHCMISC[0...3]x00000360 (IOHC::IOHC_DMA_ORIG_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000360; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000360; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	DMA_EnableEarlyOrigClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early OrigClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	DMA_EnableEarlyOrigClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early OrigClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOHCMISC[0...3]x00000364 (IOHC::IOHC_NCM_ORIG_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000364; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000364; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	NCM_EnableEarlyOrigClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early OrigClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	NCM_EnableEarlyOrigClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early OrigClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOHCMISC[0...3]x00000368 (IOHC::IOHC_HST_COMP_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000368; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000368; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	HST_EnableEarlyCompClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early CompClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	HST_EnableEarlyCompClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early CompClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOHCMISC[0...3]x0000036C (IOHC::IOHC_DMA_COMP_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000036C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000036C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	DMA_EnableEarlyCompClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early CompClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	DMA_EnableEarlyCompClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early CompClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOHCMISC[0...3]x00000370 (IOHC::IOHC_NCM_COMP_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000370; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000370; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	NCM_EnableEarlyCompClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early CompClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	NCM_EnableEarlyCompClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early CompClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOHCMISC[0...3]x00000374 (IOHC::IOHC_ORIG_TO_COMP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000374; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000374; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	EnableOrigtoCompClkReq. Read-write. Reset: 0000_0000h. These bits enable asserting CompClkReq upon receiving OrigClkReq from the same client, bit 0: Client0, bit 1: Client1, etc.

IOHCMISC[0...3]x000003F0 (IOHC::SCRATCH_4)

Read-write. Reset: 0000_0000h.

scratch registers.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x000003F0; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x000003F0; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description31:0 **SCRATCH_4.** Read-write. Reset: 0000_0000h. Scratch bits.**IOHCMISC[0...3]x000003F4 (IOHC::SCRATCH_5)**

Read-write. Reset: 0000_0000h.

scratch registers.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x000003F4; IOHCMISC[1:0]=13[C:B]1_0000h

Bits Description

31:26 Reserved.

25:16 **TrapS2Number.** Read-only. Indicates the stage 2 trap number associated with the last trapped request.

15:13 Reserved.

12 **TrapS2Vld.** Read-only. Indicates a request has been captured with stage 2 nested trap.11:8 **TrapNumber.** Read-only. Indicates the trap number associated with the last trapped request.

7:1 Reserved.

0 **TrapReqValid.** Read-only. Indicates a request has been captured by the trap block. It is automatically cleared when a response is triggered.

IOHCMISC[0...3]x00000404 (IOHC::TRAP_REQUEST0)

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000404; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000404; IOHCMISC[3:2]=13[E:D]1_0000h**Bits Description**31:2 **TrapReqAddrLo.** Read-only. Address bits 31:2 of the trapped request.

1:0 Reserved.

IOHCMISC[0...3]x00000408 (IOHC::TRAP_REQUEST1)

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000408; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000408; IOHCMISC[3:2]=13[E:D]1_0000h**Bits Description**31:0 **TrapReqAddrHi.** Read-only. Address bits 63:32 of the trapped request.**IOHCMISC[0...3]x0000040C (IOHC::TRAP_REQUEST2)**

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000040C; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000040C; IOHCMISC[3:2]=13[E:D]1_0000h**Bits Description**

31:22 Reserved.

21:16 **TrapReqLen.** Read-only. SDP length field of the trapped request.15:8 **TrapAttr.** Read-only. SDP attribute field of the trapped request.

7:6 Reserved.

5:0 **TrapReqCmd.** Read-only. SDP command field of the trapped request.**IOHCMISC[0...3]x00000410 (IOHC::TRAP_REQUEST3)**

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000410; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000410; IOHCMISC[3:2]=13[E:D]1_0000h**Bits Description**

31:22 Reserved.

21:16 **TrapReqUnitID.** Read-only. SDP UnitID field of the trapped request.

15:10 Reserved.

9 **TrapReqRspPassPW.** Read-only. SDP RspPassPW field of the trapped request.8 **TrapReqPassPW.** Read-only. SDP PassPW field of the trapped request.7 **TrapReqIO.** Read-only. SDP ReqIO field of the trapped request.6 **TrapReqChain.** Read-only. SDP Chain field of the trapped request.5:4 **TrapReqBlockLevel.** Read-only. SDP Block Level field of the trapped request.

3 Reserved.

2:0 **TrapReqVC.** Read-only. SDP VC field of the trapped request.**IOHCMISC[0...3]x00000414 (IOHC::TRAP_REQUEST4)**

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000414; IOHCMISC[1:0]=13[C:B]1_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000414; IOHCMISC[3:2]=13[E:D]1_0000h**Bits Description**

31:4 Reserved.

3:0 **TrapReqSecLevel.** Read-only. SDP security level field of the trapped request.

IOHCMISC[0...3]x00000418 (IOHC::TRAP_REQUEST5)

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000418; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000418; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:16	Reserved.
15:8	TrapReqDataParity. Read-only. Description: SDP data parity of the trapped request. First 4 bits are from the first data cycle, and second 4 bits are from the second data cycle.
7:5	Reserved.
4	TrapReqDataErr. Read-only. SDP OR'd data error status of all data cycles of the trapped request.
3	Reserved.
2:0	TrapReqDataVC. Read-only. SDP data strobes of the trapped request.

IOHCMISC[0...3]x00000420 (IOHC::TRAP_REQUEST_DATASTRB0)

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000420; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000420; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	TrapReqDataBytEn0. Read-only. SDP data strobes 31:0 of the trapped request.

IOHCMISC[0...3]x00000424 (IOHC::TRAP_REQUEST_DATASTRB1)

Read-only.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00000424; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00000424; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	TrapReqDataBytEn1. Read-only. SDP data strobes 63:32 of the trapped request.

IOHCMISC0x00000440...IOHCMISC3x0000047C (IOHC::TRAP_REQUEST_DATA)

Read-only.

_iohub0_n[15:0]_nbio0_aliasSMN; IOHCMISC0x0000_04[7C,78,74,70,6C,68,64,60,5C,58,54,50,4C,48,44,40]; IOHCMISC0=13B1_0000h

_iohub1_n[15:0]_nbio0_aliasSMN; IOHCMISC1x0000_04[7C,78,74,70,6C,68,64,60,5C,58,54,50,4C,48,44,40]; IOHCMISC1=13C1_0000h

Bits	Description
31:0	TrapReqData. Read-only. Trapped request data.

IOHCMISC[0...3]x000004C0 (IOHC::TRAP_RESPONSE_CONTROL)

Write-only. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x000004C0; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x000004C0; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:2	Reserved.
1	TrapRspReqPassthru. Write-only. Reset: 0. Allow trapped request to be re-injected back in.
0	TrapRspTrigger. Write-only. Reset: 0. Writing to this register causes the programmed trap response to be issued.

IOHCMISC[0...3]x000004C4 (IOHC::TRAP_RESPONSE0)

Read-write. Reset: 0000_0000h.

_iohub0_n[15:0]_nbio0_aliasSMN; IOHCMISC[1:0]x000004C4; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub1_n[15:0]_nbio1_aliasSMN; IOHCMISC[3:2]x000004C4; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:24	Reserved.
23:16	TrapRspDataStatus . Read-write. Reset: 00h. The first 2 bits of this register form SDP RspDataStatus field the first response data cycle. The second pair of bits are used for the second response data cycle.
15:8	Reserved.
7:4	TrapRspStatus . Read-write. Reset: 0h. Trap response SDP RspStatusfield. This is used for both read and write response.
3:1	Reserved.
0	TrapRspPassPW . Read-write. Reset: 0. Trap response SDP RspPassPW field

IOHCMISC0x00000500...IOHCMISC3x0000053C (IOHC::TRAP_RESPONSE_DATA)

Read-write. Reset: 0000_0000h.

_iohub0_n[15:0]_nbio0_aliasSMN; IOHCMISC0x0000_05[3C,38,34,30,2C,28,24,20,1C,18,14,10,0C,08,04,00]; IOHCMISC0=13B1_0000h

IOHCMISC[0...3]x00004008 (IOHC::SB_IO_BASE_LIMIT)

Read-write. Reset: 0000h.

I/O Base Register Limit is used by the iFCH to determine when to forward I/O transactions from one interface to the other.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004008; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004008; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
15:12	IO_LIMIT . Read-write. Reset: 0h. I/O Limit.
11:8	Reserved.
7:4	IO_BASE . Read-write. Reset: 0h. I/O Base.
3:0	Reserved.

IOHCMISC[0...3]x0000400C (IOHC::SB_MEM_BASE_LIMIT)

Read-write. Reset: 0000_0000h.

Memory Limit Register defines a memory mapped I/O address range which is used by the iFCH to determine when to forward memory transactions from one interface to the other.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000400C; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000400C; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:20	MEM_LIMIT_31_20 . Read-write. Reset: 000h. Memory Limit.
19:16	Reserved.
15:4	MEM_BASE_31_20 . Read-write. Reset: 000h. Memory Base Register.
3:0	Reserved.

IOHCMISC[0...3]x00004010 (IOHC::SB_PREF_BASE_LIMIT)

Read-write. Reset: 0000_0000h.

Prefetchable Memory Base Limit indicates 64-bit addresses are supported.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004010; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004010; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:20	PREF_MEM_LIMIT_31_20 . Read-write. Reset: 000h. Prefetchable Memory Limit.
19:16	Reserved.
15:4	PREF_MEM_BASE_31_20 . Read-write. Reset: 000h. Prefetchable Memory Base.
3:0	Reserved.

IOHCMISC[0...3]x00004014 (IOHC::SB_PREF_BASE_UPPER)

Read-write. Reset: 0000_0000h.

Prefetchable Memory Base Upper 32 bits.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004014; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004014; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:0	PREF_BASE_UPPER . Read-write. Reset: 0000_0000h. Upper 32 bits for 64-bit address.

IOHCMISC[0...3]x00004018 (IOHC::SB_PREF_LIMIT_UPPER)

Read-write. Reset: 0000_0000h.

Prefetchable Memory Limit Upper 32 bits.

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004018; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004018; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:0	PREF_LIMIT_UPPER . Read-write. Reset: 0000_0000h. Upper 32 bits for 64-bit address.

IOHCMISC[0...3]x0000401C (IOHC::SB_IO_BASE_LIMIT_HI)

Read-write. Reset: 0000_0000h.

I/O Base and I/O Limit Upper 16 bits.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000401C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000401C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description31:16 **IO_LIMIT_31_16**. Read-write. Reset: 0000h. Upper 16 bits for 32-bit address.15:0 **IO_BASE_31_16**. Read-write. Reset: 0000h. Upper 16 bits for 32-bit address.**IOHCMISC[0...3]x00004020 (IOHC::SB_IRQ_BRIDGE_CNTL)**

Read-write. Reset: 0000h.

Bridge Control Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004020; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004020; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description

15:5 Reserved.

4 **VGA_DEC**. Read-write. Reset: 0. Enables the iFCH to provide 16-bit decoding of VGA I/O address precluding the decoding of alias addresses every 1 kB (ie. requires address bits 15:10=0).3 **VGA_EN**. Read-write. Reset: 0. Enable fixed VGA memory and IO regions decode to the iFCH. 16-bit VGA IO ranges are address bits 31:16=0, 9:0=3B0 to 3BB or 9:0=3C0 to 3DF. VGA memory range is A_0000h to B_FFFFh.2 **ISA_EN**. Read-write. Reset: 0. Enable fixed ISA IO regions decode to the iFCH. ISA regions are within the first 256B of each 1K address range (ie. address bits 31:16=0 and 9:8=0).

1:0 Reserved.

IOHCMISC[0...3]x00004024 (IOHC::SB_EXT_BRIDGE_CNTL)

Read-write. Reset: 00h.

External Bridge Control Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004024; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004024; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description

7:1 Reserved.

0 **IO_PORT_80_EN**. Read-write. Reset: 0. Register to enable IO port 80 decoding. Enables fixed IO decode to address 0x80 or 0x1080 to iFCH.**IOHCMISC[0...3]x00004028 (IOHC::SB_PMI_STATUS_CNTL)**

Read-write. Reset: 00h.

Power Management Control and Status Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004028; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004028; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description

7:2 Reserved.

1:0 **POWER_STATE**. Read-write. Reset: 0h.**Description:** Determine the current power state.

00b - D0

01b - Reserved

10b - Reserved

11b - D3

IOHCMISC[0...3]x0000402C (IOHC::SB_SLOT_CAP)

Read-write. Reset: 0000_0000h.

The Slot Capabilities register identifies PCI Express slot specific capabilities.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000402C; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000402C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:17	Reserved.
16:15	SLOT_PWR_LIMIT_SCALE. Read-write. Reset: 0h. Specifies the scale used for the Slot Power Limit Value.
14:7	SLOT_PWR_LIMIT_VALUE. Read-write. Reset: 00h. In combination with the Slot Power Limit Scale value, specifies the upper limit on power supplied by slot.
6:0	Reserved.

IOHCMISC[0...3]x00004030 (IOHC::SB_ROOT_CNTL)

Read-write. Reset: 0000h.

The Root Control register controls PCI Express Root Complex specific parameters.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004030; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004030; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
15:5	Reserved.
4	CRS_SOFTWARE_VISIBILITY_EN. Read-write. Reset: 0. This bit when set enables the Root Port to return Configuration Request Retry Status Completion Status to software.
3:0	Reserved.

IOHCMISC[0...3]x00004034 (IOHC::SB_DEVICE_CNTL2)

Read-write. Reset: 0000h.

The Device Control 2 register controls PCI Express device specific parameters.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004034; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004034; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
15:6	Reserved.
5	ARI_FORWARDING_EN. Read-write. Reset: 0. ARI Forwarding enable. When set, this assumes Dev number=0 and allows 8-bit Fn number. Otherwise, it is required that Dev=0 for external config request decoding.
4:0	Reserved.

IOHCMISC[0...3]x00004040 (IOHC::IOHC_QOS_CONTROL)

Read-write. Reset: E000_0000h.

Set QoSPriority per VC for DMA requests sent to the SDF.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004040; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004040; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:28	VC7QoSPriority. Read-write. Reset: Eh. VC7QoSPriority.
27:24	VC6QoSPriority. Read-write. Reset: 0h. VC6QoSPriority.
23:20	VC5QoSPriority. Read-write. Reset: 0h. VC5QoSPriority.
19:16	VC4QoSPriority. Read-write. Reset: 0h. VC4QoSPriority.
15:12	VC3QoSPriority. Read-write. Reset: 0h. VC3QoSPriority.
11:8	VC2QoSPriority. Read-write. Reset: 0h. VC2QoSPriority.
7:4	VC1QoSPriority. Read-write. Reset: 0h. VC1QoSPriority.
3:0	VC0QoSPriority. Read-write. Reset: 0h. VC0QoSPriority.

IOHCMISC[0...3]x00004044 (IOHC::USB_QoS_CNTL)

Read-write. Reset: 0000_0000h.

programmed UnitID is seen being sent to [DE](#), when we set to the QoSPriority to the programmed value`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004044; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004044; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:29	Reserved.
28	UnitID1Enable. Read-write. Reset: 0. Enable UnitIDQoSPriority setting for UnitID1
27:24	UnitID1QoSPriority. Read-write. Reset: 0h. QoSPriority to set for UnitID1
23	Reserved.
22:16	UnitID1. Read-write. Reset: 00h. UnitID to set QoSPriority
15:13	Reserved.
12	UnitID0Enable. Read-write. Reset: 0. Enable UnitIDQoSPriority setting for UnitID0
11:8	UnitID0QoSPriority. Read-write. Reset: 0h. QoSPriority to set for UnitID0
7	Reserved.
6:0	UnitID0. Read-write. Reset: 00h. UnitID to set QoSPriority

IOHCMISC[0...3]x00004048 (IOHC::IOHC_NCM_QOS_CONTROL)

Read-write. Reset: 0000_0000h.

set QoSPriority per VC for DMA requests sent to the NCM

`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00004048; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00004048; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:28	VC7NCMQoSPriority. Read-write. Reset: 0h. VC7NCMQoSPriority.
27:24	VC6NCMQoSPriority. Read-write. Reset: 0h. VC6NCMQoSPriority.
23:20	VC5NCMQoSPriority. Read-write. Reset: 0h. VC5NCMQoSPriority.
19:16	VC4NCMQoSPriority. Read-write. Reset: 0h. VC4NCMQoSPriority.
15:12	VC3NCMQoSPriority. Read-write. Reset: 0h. VC3NCMQoSPriority.
11:8	VC2NCMQoSPriority. Read-write. Reset: 0h. VC2NCMQoSPriority.
7:4	VC1NCMQoSPriority. Read-write. Reset: 0h. VC1NCMQoSPriority.
3:0	VC0NCMQoSPriority. Read-write. Reset: 0h. VC0NCMQoSPriority.

IOHCMISC[0...3]x0000404C (IOHC::IOHC_QOS_CONTROL2)

Read-write. Reset: 0000_0000h.

programmed UnitID is seen being sent to [DE](#), when we set to the QoSPriority to the programmed value`_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x0000404C; IOHCMISC[1:0]=13[C:B]1_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x0000404C; IOHCMISC[3:2]=13[E:D]1_0000h`

Bits	Description
31:29	Reserved.
28	UnitID3Enable. Read-write. Reset: 0. Enable UnitIDQoSPriority setting for UnitID1
27:24	UnitID3QoSPriority. Read-write. Reset: 0h. QoSPriority to set for UnitID1
23	Reserved.
22:16	UnitID3. Read-write. Reset: 00h. UnitID to set QoSPriority
15:13	Reserved.
12	UnitID2Enable. Read-write. Reset: 0. Enable UnitIDQoSPriority setting for UnitID0
11:8	UnitID2QoSPriority. Read-write. Reset: 0h. QoSPriority to set for UnitID0
7	Reserved.
6:0	UnitID2. Read-write. Reset: 00h. UnitID to set QoSPriority

IOHCMISC[0...3]x0000405C (IOHC::MPIO_SMN_INT_REQ_ADDR)

Read-write. Reset: 0000_0000h.

[SMN](#) write address for [MPIO](#) Ring Buffer doorbell Interrupt.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x0000405C; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x0000405C; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:20	Reserved.
19:0	SMN_MPIO_REQ_ADDR . Read-write. Reset: 0_0000h. SMN write address for MPIO Ring Buffer doorbell Interrupt.

IOHCMISC[0...3]x00004060 (IOHC::MPIO_SMN_INT_MCM_ADDR)

Read-write. Reset: 0000_0000h.

[SMN](#) write mcm address for [MPIO](#) Ring Buffer doorbell Interrupt.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00004060; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00004060; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:8	Reserved.
7:0	SMN_MPIO_MCM_ADDR . Read-write. Reset: 00h. SMN write mcm address for MPIO Ring Buffer doorbell Interrupt.

IOHCMISC[0...3]x00004064 (IOHC::MPIO_SMN_INT_APERTUREID)

Read-write. Reset: 0000_0000h.

[SMN](#) write apertureID for [MPIO](#) Ring Buffer doorbell Interrupt.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCMISC[1:0]x00004064; IOHCMISC[1:0]=13[C:B]1_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCMISC[3:2]x00004064; IOHCMISC[3:2]=13[E:D]1_0000h

23:0 **IOHC_SION_COUNTER1_UPPER**. Read-only, Volatile. Read back value of Counter 1 bit 55:32.**IOHCMISC[0...3]x00005CB8 (IOHC::IOHC_SION_PERF_COUNT2)**

Read-only, Volatile.

IOHC SION Performance Counter 2.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CB8; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CB8; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description31:0 **IOHC_SION_COUNTER2**. Read-only, Volatile. Read back value of Counter 2 bit 31:0.**IOHCMISC[0...3]x00005CBC (IOHC::IOHC_SION_PERF_COUNT2_UPPER)**

Read-only, Volatile.

IOHC SION Performance Counter 2.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CBC; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CBC; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description

31:24 Reserved.

23:0 **IOHC_SION_COUNTER2_UPPER**. Read-only, Volatile. Read back value of Counter 2 bit 55:32.

IOHCMISC[0...3]x00005CC0 (IOHC::IOHC_SION_PERF_COUNT3)

Read-only, Volatile.

IOHC SION Performance Counter 3.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CC0; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CC0; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description31:0 **IOHC_SION_COUNTER3**. Read-only, Volatile. Read back value of Counter 3 bit 33:0.**IOHCMISC[0...3]x00005CC4 (IOHC::IOHC_SION_PERF_COUNT3_UPPER)**

Read-only, Volatile.

IOHC SION Performance Counter 3.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CC4; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CC4; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description

31:24 Reserved.

23:0 **IOHC_SION_COUNTER3_UPPER**. Read-only, Volatile. Read back value of Counter 3 bit 55:32.**IOHCMISC[0...3]x00005CC8 (IOHC::NB_CXL_CFG1)**

Read-write. Reset: 0000_01FFh.

CXL™ Configuration Register 1

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CC8; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CC8; IOHCMISC[3:2]=13[E:D]1_0000h

Bits Description

31:9 Reserved.

8 **PCIE0_PORTI_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTI CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally7 **PCIE0_PORTH_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTH CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally6 **PCIE0_PORTG_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTG CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally5 **PCIE0_PORTF_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTF CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally4 **PCIE0_PORTE_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTE CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally3 **PCIE0_PORTD_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTD CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally2 **PCIE0_PORTC_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTC CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally1 **PCIE0_PORTB_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTB CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally0 **PCIE0_PORTA_CXL_RCEC_ERR_EN**. Read-write. Reset: 1. PCIE0 PORTA CXL™ RCEC Error Enable: When set, the IOHC is permitted to route the RCEC Errors to IOAPIC, otherwise, the RCEC Errors are dropped internally

IOHCMISC[0...3]x00005CCC (IOHC::NB_CXL_CFG2)

Read-write. Reset: 0000_0001h.

CXL™ Configuration Register 2

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CCC; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CCC; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:2	Reserved.
1	CXL_DEFERABLE_WR_EN. Read-write. Reset: 0. CXL™ Deferable Write Enable: When set, the IOHC is permitted to route the NPMemWr32/64 host transaction to CXL™ devices, otherwise, it would be dropped internally
0	CXL_RCEC_REG_EN. Read-write. Reset: 1. CXL™ RCEC Configuration space access enable: When set, the IOHC would decode the configuration trans for CXL™ RCEC, otherwise, the IOHC would not decode the transactions.

IOHCMISC[0...3]x00005CD0 (IOHC::NB_PCIE0_PORTA_CXL_RCRB_BASE_ADDR_LO)

Read-write. Reset: 0000_0000h.

PCIE0 PORTA CXL™ RCRB Base Register Low.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CD0; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CD0; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:13	PCIE0_PORTA_CXL_RCRB_BASE_ADDR_LO_31_13. Read-write. Reset: 0_0000h. PCIE0 PORTA CXL™ RCRB Base Address [31:13], This points to an 8K memory region where the lower 4K hosts the downstream port RCRB and the upper 4K hosts the upstream port RCRB.
12:1	Reserved.
0	PCIE0_PORTA_CXL_RCRB_ENABLE. Read-write. Reset: 0. PCIE0 PORTA CXL™ RCRB Enable: When set, the RCRB region is enabled.

IOHCMISC[0...3]x00005CD4 (IOHC::NB_PCIE0_PORTA_CXL_RCRB_BASE_ADDR_HI)

Read-write. Reset: 0000_0000h.

PCIE0 PORTA CXL™ RCRB Base Register High.

_iohub[1:0]_nbio0_aliasSMN; IOHCMISC[1:0]x00005CD4; IOHCMISC[1:0]=13[C:B]1_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMISC[3:2]x00005CD4; IOHCMISC[3:2]=13[E:D]1_0000h

Bits	Description
31:0	PCIE0_PORTA_CXL_RCRB_BASE_ADDR_HI. Read-write. Reset: 0000_0000h. High 32 bits of PCIE0 PORTA CXL™ RCRB Base Address [63:13]. This points to an 8K memory region where the lower 4K hosts the downstream port RCRB and the upper 4K hosts the upstream port RCRB.

IOHCMISC[0...3]x00005CD8 (IOHC::NB_PCIE0_PORTB_CXL_RCRB_BASE_ADDR_LO)

Read-write. Reset: 0000_0000h.

PCIE0 PORTB CXL™ RCRB Base Register Low.

IOHCMPIO3=13E6_0000h	
Bits	Description
31:24	BYTE3. Read-write. Reset: 00h. Data Byte of for IOHC--> MPIO MCTP Ring Buffer.
23:16	BYTE2. Read-write. Reset: 00h. Data Byte of for IOHC--> MPIO MCTP Ring Buffer.
15:8	BYTE1. Read-write. Reset: 00h. Data Byte of for IOHC--> MPIO MCTP Ring Buffer.
7:0	BYTE0. Read-write. Reset: 00h. Data Byte of for IOHC--> MPIO MCTP Ring Buffer.

IOHCMPIO[0...3]x00003000 (IOHC::IOHC_CXLVDM_CNTL_0)

Read-only. Reset: 0000_0001h.

_iohub[1:0]_nbio0_aliasSMN; IOHCMPIO[1:0]x00003000; IOHCMPIO[1:0]=13[C:B]6_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMPIO[3:2]x00003000; IOHCMPIO[3:2]=13[E:D]6_0000h

Bits	Description
31:0	Revision_ID. Read-only. Reset: 0000_0001h. IOHC CXLVDM Revision ID.

IOHCMPIO[0...3]x00003004 (IOHC::IOHC_CXLVDM_CNTL_1)

Read-only. Reset: 0000_0010h.

_iohub[1:0]_nbio0_aliasSMN; IOHCMPIO[1:0]x00003004; IOHCMPIO[1:0]=13[C:B]6_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMPIO[3:2]x00003004; IOHCMPIO[3:2]=13[E:D]6_0000h

Bits	Description
31:0	HeaderDepth. Read-only. Reset: 0000_0010h. IOHC CXLVDM maximum number of MSG headers ring buffer can store.

IOHCMPIO[0...3]x00003008 (IOHC::IOHC_CXLVDM_CNTL_2)

Read-only. Reset: 0000_0002h.

_iohub[1:0]_nbio0_aliasSMN; IOHCMPIO[1:0]x00003008; IOHCMPIO[1:0]=13[C:B]6_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMPIO[3:2]x00003008; IOHCMPIO[3:2]=13[E:D]6_0000h

Bits	Description
31:0	DWPerHeader . Read-only. Reset: 0000_0002h. Number of double words per header.

IOHCMPIO[0...3]x0000300C (IOHC::IOHC_CXLVDM_CNTL_3)

Read-only. Reset: 0000_0100h.

_iohub[1:0]_nbio0_aliasSMN; IOHCMPIO[1:0]x0000300C; IOHCMPIO[1:0]=13[C:B]6_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCMPIO[3:2]x0000300C; IOHCMPIO[3:2]=13[E:D]6_0000h

Bits	Description
31:0	PayloadDepth . Read-only. Reset: 0000_0100h. Number of bytes available accross request payloads.

IOHCMPIO[0...3]x00003010 (IOHC::IOHC_CXLVDM_CNTL_4)

Read-only. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCMPIO[1:0]x00003010; IOHCMPIO[1:0]=13[C:B]6_0000h

Read-write. Reset: 0000_0000h.

IOHC uses this information to determine if IOMMU is enabled.

`_iohub[1:0]_nbio0_aliasSMN; IOHCPCIESHADOW[1:0]x00000000; IOHCPCIESHADOW[1:0]=13[C:B]0_1000h``_iohub[1:0]_nbio1_aliasSMN; IOHCPCIESHADOW[3:2]x00000000; IOHCPCIESHADOW[3:2]=13[E:D]0_1000h`**Bits Description**

31:1	Reserved.
0	IOMMU_EN. Read-write. Reset: 0. 1=IOMMU enabled. All upstream transactions are translated by the IOMMU. The Device Table Base Address Register [MMIO Offset 0000h] must be configured by software before setting this bit. 0=IOMMU is disabled and no upstream transactions are translated or remapped by the IOMMU. When disabled, the IOMMU reads no commands and creates no event log entries. Software note: Software must configure EventLogEn and CmdBufEn.

IOHPCIESHADOW[0...3]x00000004 (IOHC::SHADOW_IOMMU_CAP_BASE_LO)

Read-write. Reset: 0000_0000h.

IOHC uses this information to decode requests to the IOMMU memory-mapped register space and forward them to RSMU.

_iohub[1:0]_nbio0_aliasSMN; IOHPCIESHADOW[1:0]x00000004; IOHPCIESHADOW[1:0]=13[C:B]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOHPCIESHADOW[3:2]x00000004; IOHPCIESHADOW[3:2]=13[E:D]0_1000h

Bits	Description
31:19	IOMMU_BASE_ADDR_LO. Read-write. Reset: 0000h. Specifies address bits 31:19 of the 512K-byte-aligned base address of the IOMMU memory-mapped control registers.
18:1	Reserved.
0	IOMMU_ENABLE. Read-write. Reset: 0. 1=IOMMU accepts memory accesses to the address specified in the Base Address Register. When Enable is written with a 1, all IOMMU RW capability registers in PCI configuration space are locked until the next system reset.

IOHPCIESHADOW[0...3]x00000008 (IOHC::SHADOW_IOMMU_CAP_BASE_HI)

Read-write. Reset: 0000_0000h.

IOHC uses this information to decode requests to the IOMMU memory-mapped register space and forward them to RSMU.

_iohub[1:0]_nbio0_aliasSMN; IOHPCIESHADOW[1:0]x00000008; IOHPCIESHADOW[1:0]=13[C:B]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOHPCIESHADOW[3:2]x00000008; IOHPCIESHADOW[3:2]=13[E:D]0_1000h

Bits	Description
31:0	IOMMU_BASE_ADDR_HI. Read-write. Reset: 0000_0000h. Specifies address bits 63:32 of the 512K-byte-aligned base address of the IOMMU memory-mapped control registers.

IOHPCIESHADOW[0...3]x000000D0 (IOHC::SHADOW_IOMMU_VF_BASE_LO)

Read-write. Reset: 0000_0000h.

IOHC uses this information to decode requests to the IOMMU Virtual Function Base Address Range.

_iohub[1:0]_nbio0_aliasSMN; IOHPCIESHADOW[1:0]x000000D0; IOHPCIESHADOW[1:0]=13[C:B]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOHPCIESHADOW[3:2]x000000D0; IOHPCIESHADOW[3:2]=13[E:D]0_1000h

Bits	Description
31:28	VF_BASE_ADDR_LO. Read-write. Reset: 0h. Specifies address bits 31:28 of the 256M-byte-aligned base address of the VF memory-mapped control registers.
27:1	Reserved.
0	VF_ENABLE. Read-write. Reset: 0. 1=IOMMU accepts memory accesses to the address specified in the VF Base Address Register. When Enable is written with a 1, the register space are locked until the next system reset.

IOHPCIESHADOW[0...3]x000000D4 (IOHC::SHADOW_IOMMU_VF_BASE_HI)

Read-write. Reset: 0000_0000h.

IOHC uses this information to decode requests to the IOMMU Virtual Function Base Address Range.

_iohub[1:0]_nbio0_aliasSMN; IOHPCIESHADOW[1:0]x000000D4; IOHPCIESHADOW[1:0]=13[C:B]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOHPCIESHADOW[3:2]x000000D4; IOHPCIESHADOW[3:2]=13[E:D]0_1000h

Bits	Description
31:0	VF_BASE_ADDR_HI. Read-write. Reset: 0000_0000h. Specifies address bits 63:32 of the 256M-byte-aligned base address of the VF memory-mapped control registers.

IOHCPCIESHADOW[0...3]x000000D8 (IOHC::SHADOW_IOMMU_VFCNTL_BASE_LO)

Read-write. Reset: 0000_0000h.

IOHC uses this information to decode requests to the IOMMU Virtual Function CNTL Base Address Range.

_iohub[1:0]_nbio0_aliasSMN; IOHCPCIESHADOW[1:0]x000000D8; IOHCPCIESHADOW[1:0]=13[C:B]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOHCPCIESHADOW[3:2]x000000D8; IOHCPCIESHADOW[3:2]=13[E:D]0_1000h

Bits	Description
31:22	VFCNTL_BASE_ADDR_LO. Read-write. Reset: 000h. Specifies address bits 31:22 of the 4M-byte-aligned base address of the VFCNTL memory-mapped control registers.
21:1	Reserved.
0	VFCNTL_ENABLE. Read-write. Reset: 0. 1=IOMMU accepts memory accesses to the address specified in the VFCNTL Base Address Register. When Enable is written with a 1, the register space are locked until the next system reset.

IOHCPCIESHADOW[0...3]x000000DC (IOHC::SHADOW_IOMMU_VFCNTL_BASE_HI)

Read-write. Reset: 0000_0000h.

IOHC uses this information to decode requests to the IOMMU Virtual Function CNTL Base Address Range.

_iohub[1:0]_nbio0_aliasSMN; IOHCPCIESHADOW[1:0]x000000DC; IOHCPCIESHADOW[1:0]=13[C:B]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOHCPCIESHADOW[3:2]x000000DC; IOHCPCIESHADOW[3:2]=13[E:D]0_1000h

Bits	Description
31:0	VFCNTL_BASE_ADDR_HI. Read-write. Reset: 0000_0000h. Specifies address bits 63:32 of the 4M-byte-aligned base address of the VFCNTL memory-mapped control registers..

IOHCRAS[0...3]x00000000 (IOHC::PARITY_CONTROL_0)

Read-write. Reset: 0001_0001h.

Parity Control Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000000; IOHCRAS[1:0]=13[C:B]2_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000000; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:16	ParityUCPThreshold. Read-write. Reset: 0001h. Specifies the number of ucp parity errors logged before an action is triggered. The errors are counted per parity error group which may encompass multiple errors from multiple structures.
15:0	ParityCorrThreshold. Read-write. Reset: 0001h. Specifies the number of correctable parity errors logged before an action is triggered. The errors are counted per parity error group which may encompass multiple errors from multiple structures.

IOHCRAS[0...3]x00000004 (IOHC::PARITY_CONTROL_1)

Reset: 8000_0000h.

Parity Error Injection Control Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000004; IOHCRAS[1:0]=13[C:B]2_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000004; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31	ParityErrGenInjectAllow. Read-only. Reset: 1. Software must poll this bit and make sure this bit is asserted before updating the rest of the fields in this register. When asserted, it indicates that there are no pending ErrGen commands outstanding.
30	ParityErrGenTrigger. Write-only. Reset: 0. Writing this bit to 1 triggers the command defined by the other ParityErrGen* fields in this register, doesn't require clear the bits before next write.
29:20	Reserved.
19:16	ParityErrGenCmd. Read-write. Reset: 0h. Description: Software must wait for the ParityErrGenInjectAllow bit to be asserted before updating this register. Encoding for Uncorrectable and Correctable Parity Wrappers: 0000 - Reserved 0001 - Error Injection on Write Side 0010 - Error Injection on Read Side 0011 - Reserved 0100 - Disable Error Reporting 0101 - Enable Error Reporting 0110 - Reserved 0111-1111 - Reserved Encoding for ECC Parity Wrappers: 0000 - Disable ECC Error Detection and Correction 0001 - Enable ECC Error Detection and Correction 0010 - SEC Error Injection 0011 - Disable SEC Error Reporting 0100 - Enable SEC Error Reporting 0101 - DED Error Injection 0110 - Disable DED Error Reporting 0111 - Enable DED Error Reporting 1000 - Disable Conversion of DED Errors to Poisoned Data 1001 - Enable Conversion of DED Errors to Poisoned Data 1010 - UCP Error Injection 1011 - Disable UCP Error Reporting 1100 - Enable UCP Error Reporting 1101-1111 - Reserved
15:11	ParityErrGenIdSel. Read-write. Reset: 00h. Selects a structure within the target parity group for error injection or masking. Software must wait for the ParityErrGenInjectAllow bit to be asserted before updating this register.
10:9	Reserved.
8	ParityErrGenGroupTypeSel. Read-write. Reset: 0. Description: Select Group Type: 0 - Uncorrectable Group Type 1 - Correctable Group Type. Software must wait for the ParityErrGenInjectAllow bit to be asserted before updating this register. For ECC error injection, this field is a don't care.
7:0	ParityErrGenGroupSel. Read-write. Reset: 00h. Description: Controls the parity error group that is the target of error injection or masking. Software must wait for the ParityErrGenInjectAllow bit to be asserted before updating this register.

IOHCRAS[0...3]x00000008 (IOHC::PARITY_SEVERITY_CONTROL_UNCORR_0)

Read-write. Reset: 0000_0000h.

Parity Uncorrectable Groups Error Severity Control Register.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000008; IOHCRAS[1:0]=13[C:B]2_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000008; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:30	ParityErrSevUnCorrGrp15. Read-write. Reset: 0h. Description: Controls the error severity detected in uncorrectable parity error group 15: 11=System Error 10=Fatal 01=Non-fatal 00=Correctable

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x00000210 (IOHC::PCIE0PortAIntNonFatal_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a IntNonFatal error

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000210; IOHCRAS[1:0]=13[C:B]2_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000210; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x00000214 (IOHC::PCIE0PortAIntCorr_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a IntCorr error

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000214; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000214; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.

IOHCRAS[0...3]x00000254 (IOHC::PCIE0PortCIntCorr_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a IntCorr error

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000254; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000254; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x00000258 (IOHC::PCIE0PortCExtFatal_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port receives a ExtFatal_ERR message over the [PCIe](#) link[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000258; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000258; IOHCRAS[3:2]=13[E:D]2_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x000002E0; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x000002E4 (IOHC::PCIE0PortGParityErr_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port's primary side ParityErr_DETECTED status is set

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x000002E4; IOHCRAS[1:0]=13[C:B]2_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x000002E4; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MPI to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x000002E8 (IOHC::PCIE0PortHSerr_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a Serr error

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x000002E8; IOHCRAS[1:0]=13[C:B]2_0000h

IOHCRAS[0...3]x00000328 (IOHC::PCIE1PortASerr_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a Serr error

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000328; IOHCRAS[1:0]=13[C:B]2_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000328; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MPI to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x0000032C (IOHC::PCIE1PortAIntFatal_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a IntFatal error

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x000003FC; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x00000400 (IOHC::PCIE1PortGExtCorr_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port receives a ExtCorr_ERR message over the [PCIe](#) link

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000400; IOHCRAS[1:0]=13[C:B]2_0000h

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a IntNonFatal error

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x000004D0; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x000004D0; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x000004D4 (IOHC::NBIF1PortAIntCorr_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port internally detects a IntCorr error

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x000004D4; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x000004D4; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:5	Reserved.
4	SyncFlood_En. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when the associated error is logged. This halts the system.
3	LinkDis_En. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when the associated error is logged. This may be used in combination with SyncFlood_En to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when the associated error is logged: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
0	APML_ERR_En. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when the associated error is logged. SMU firmware may then signal the error via APML .

IOHCRAS[0...3]x000004D8 (IOHC::NBIF1PortAExtFatal_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

The actions controlled in this register are triggered when the corresponding root port receives a ExtFatal_ERR message over the [PCIe](#) link[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x000004D8; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x000004D8; IOHCRAS[3:2]=13[E:D]2_0000h

11	SyncfloodFromIOHCPortN_11. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 3.
10	SyncfloodFromIOHCPortN_10. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 2.
9	SyncfloodFromIOHCPortN_9. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 1.

8	SyncfloodFromIOHCPortN_8. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 0.
7:6	Reserved.
5	SyncfloodFromMCA. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by MCA .
4	SyncfloodFromPrivate. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by PSP or SMU via SW_SYNCFLOOD_PRIVATE.
3	Reserved.
2	SyncfloodFromPin. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by the NMI_SYNCFLOOD# pin(LPC_SMI_LNMI_SYNC_FLOOD_L/AGPIO86).
1	SyncfloodFromAPML. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by the APML interface.
0	SyncfloodFromRASCntL. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by the I/O RAS controller.

IOHCRAS[0...3]x00000804 (IOHC::NMI_STATUS)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000804; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000804; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:1	Reserved.
0	NMIFromPin. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an NMI triggered by the pin.

IOHCRAS[0...3]x00000808 (IOHC::RAS_INTR_MASK)

Read-write. Reset: 0000_0000h.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000808; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000808; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:3	Reserved.
2	IOHC_RAS_NMI_Mask. Read-write. Reset: 0. Enables masking of NMI interrupt.
1	IOHC_RAS_SMI_Mask. Read-write. Reset: 0. Enables masking of SMI interrupt.
0	IOHC_RAS_SCI_Mask. Read-write. Reset: 0. Enables masking of SCI interrupt.

IOHCRAS[0...3]x0000080C (IOHC::RAS_ERREVENT_INGRESS_MASK)

Read-write. Reset: 0000_0000h.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x0000080C; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x0000080C; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:0	IOHC_RAS_ErrEvent_Ingress_Mask. Read-write. Reset: 0000_0000h. Description: Enables ingress masking on SDP ErrEvents received from IOHC clients. SDP ErrEvents received from the corresponding IOHC clients will not cause SDP ErrEvent broadcasting to adjacent IPs. Bit 0: IOHC client0. Bit 1: IOHC client1. etc. Bit 31: all IOHC clients.

IOHCRAS[0...3]x00000810 (IOHC::RAS_ERREVENT_EGRESS_MASK)

Read-write. Reset: 0000_0000h.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000810; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000810; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:0	IOHC_RAS_ErrEvent_Egress_Mask. Read-write. Reset: 0000_0000h. Description: Enables egress masking to IOHC clients. Disable SDP ErrEvent broadcasting to the corresponding IOHC clients. Bit 0: IOHC client0. Bit 1: IOHC client1. etc. Bit 31: all IOHC clients.

IOHCRAS[0...3]x00000814 (IOHC::POISON_ACTION_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000814; IOHCRAS[1:0]=13[C:B]2_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000814; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:21	Reserved.
20	EgressPoisonHSSyncFloodEn. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when IOHC sends high severity poisoned data to one of its clients. This halts the system.
19	EgressPoisonHSLinkDisEn. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when IOHC sends high severity poisoned data to one of its clients. This may be used in combination with EgressPoisonHSSyncFloodEn to prevent errors from being transmitted out of the processor over the PCIe interface.
18:17	EgressPoisonHSIntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when IOHC sends high severity poisoned data to one of its clients: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
16	EgressPoisonHSAPMLerrEn. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when IOHC sends high severity poisoned data to one of its clients.
15:13	Reserved.
12	EgressPoisonLSSyncFloodEn. Read-write. Reset: 0. Setting this bit to 1 causes an SDP ErrEvent to be triggered when IOHC sends low severity poisoned data to one of its clients. This halts the system.
11	EgressPoisonLSLinkDisEn. Read-write. Reset: 0. Setting this bit to 1 causes PCIe links to be disabled when IOHC sends low severity poisoned data to one of its clients. This may be used in combination with EgressPoisonLSSyncFloodEn to prevent errors from being transmitted out of the processor over the PCIe interface.
10:9	EgressPoisonLSIntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when IOHC sends low severity poisoned data to one of its clients: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.
8	EgressPoisonLSAPMLerrEn. Read-write. Reset: 0. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when IOHC sends low severity poisoned data to one of its clients.
7:5	Reserved.
4	IntPoisonSyncFloodEn. Read-write. Reset: 0. Init: BIOS,1. Setting this bit to 1 causes an SDP ErrEvent to be triggered when IOHC attempts to consume poisoned data. This halts the system.
3	IntPoisonLinkDisEn. Read-write. Reset: 0. Init: BIOS,1. Setting this bit to 1 causes PCIe links to be disabled when IOHC attempts to consume poisoned data. This may be used in combination with IntPoisonSyncFloodEn to prevent errors from being transmitted out of the processor over the PCIe interface.
2:1	IntPoisonIntrGenSel. Read-write. Reset: 0h. Description: Setting this field to a non-zero value causes an interrupt to be sent to the CPU complex when IOHC attempts to consume poisoned data: 11= SMI 10=SCI 01=NMI 00=Disable interrupt generation.

0	IntPoisonAPMLErrEn. Read-write. Reset: 0. Init: BIOS,1. Setting this bit to 1 causes an interrupt to SMU/ MP1 to be triggered when IOHC attempts to consume poisoned data.
---	---

IOHCRAS[0...3]x00000818 (IOHC::INTERNAL_POISON_STATUS)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000818; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000818; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:8	Reserved.
7	IntPoisonStatus_7. Read,Write-1-to-clear. Reset: Cold,0. Reserved.
6	IntPoisonStatus_6. Read,Write-1-to-clear. Reset: Cold,0. Reserved.
5	IntPoisonStatus_5. Read,Write-1-to-clear. Reset: Cold,0. Reserved.
4	IntPoisonStatus_4. Read,Write-1-to-clear. Reset: Cold,0. Reserved.
3	IntPoisonStatus_3. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of IOHC consuming poisoned data in the Msg block through the CXL™ ringbuffer.
2	IntPoisonStatus_2. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of IOHC consuming poisoned data in the Msg block through the MCTP ringbuffer.
1	IntPoisonStatus_1. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of IOHC consuming poisoned data in the Trap block.
0	IntPoisonStatus_0. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of IOHC consuming poisoned data in the SMN Master.

IOHCRAS[0...3]x0000081C (IOHC::INTERNAL_POISON_MASK)

Read-write. Reset: 0000_0000h.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x0000081C; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x0000081C; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:8	Reserved.
7:0	IntPoisonMask. Read-write. Reset: 00h. Enable masking of errors logged in INTERNAL_POISON_STATUS. For each bit, 1=Errors are masked 0=Errors trigger response actions.

IOHCRAS[0...3]x00000820 (IOHC::EGRESS_POISON_STATUS_LO)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000820; IOHCRAS[1:0]=13[C:B]2_0000h

_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000820; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31	EgressPoisonStatusLo_31. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
30	EgressPoisonStatusLo_30. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
29	EgressPoisonStatusLo_29. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
28	EgressPoisonStatusLo_28. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
27	EgressPoisonStatusLo_27. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
26	EgressPoisonStatusLo_26. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
25	EgressPoisonStatusLo_25. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
24	EgressPoisonStatusLo_24. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
23	EgressPoisonStatusLo_23. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
22	EgressPoisonStatusLo_22. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
21	EgressPoisonStatusLo_21. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
20	EgressPoisonStatusLo_20. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
19	EgressPoisonStatusLo_19. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
18	EgressPoisonStatusLo_18. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
17	EgressPoisonStatusLo_17. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.

16	EgressPoisonStatusLo_16. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
15	EgressPoisonStatusLo_15. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
14	EgressPoisonStatusLo_14. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
13	EgressPoisonStatusLo_13. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
12	EgressPoisonStatusLo_12. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
11	EgressPoisonStatusLo_11. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
10	EgressPoisonStatusLo_10. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
9	EgressPoisonStatusLo_9. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
8	EgressPoisonStatusLo_8. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
7	EgressPoisonStatusLo_7. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
6	EgressPoisonStatusLo_6. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
5	EgressPoisonStatusLo_5. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
4	EgressPoisonStatusLo_4. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
3	EgressPoisonStatusLo_3. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
2	EgressPoisonStatusLo_2. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
1	EgressPoisonStatusLo_1. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
0	EgressPoisonStatusLo_0. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.

IOHCRAS[0...3]x00000824 (IOHC::EGRESS_POISON_STATUS_HI)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000824; IOHCRAS[1:0]=13[C:B]2_0000h

8	EgressPoisonStatusHi_8. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
7	EgressPoisonStatusHi_7. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
6	EgressPoisonStatusHi_6. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
5	EgressPoisonStatusHi_5. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
4	EgressPoisonStatusHi_4. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
3	EgressPoisonStatusHi_3. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
2	EgressPoisonStatusHi_2. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
1	EgressPoisonStatusHi_1. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
0	EgressPoisonStatusHi_0. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.

IOHCRAS[0...3]x00000828 (IOHC::EGRESS_POISON_MASK_LO)

Read-write. Reset: 0000_0000h.

Enable masking of EGRESS_POISON STATUS.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000828; IOHCRAS[1:0]=13[C:B]2_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000828; IOHCRAS[3:2]=13[E:D]2_0000h**Bits Description**

31:0	EgressPoisonMaskLo. Read-write. Reset: 0000_0000h. Enable masking of errors logged in EGRESS_POISON_STATUS_LO. For each bit, 1=Errors are masked 0=Errors trigger response actions.
------	--

IOHCRAS[0...3]x0000082C (IOHC::EGRESS_POISON_MASK_HI)

Read-write. Reset: 0000_0000h.

Enable masking of EGRESS_POISON STATUS.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x0000082C; IOHCRAS[1:0]=13[C:B]2_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x0000082C; IOHCRAS[3:2]=13[E:D]2_0000h**Bits Description**

31:0	EgressPoisonMaskHi. Read-write. Reset: 0000_0000h. Enable masking of errors logged in EGRESS_POISON_STATUS_HI. For each bit, 1=Errors are masked 0=Errors trigger response actions.
------	--

IOHCRAS[0...3]x00000830 (IOHC::EGRESS_POISON_SEVERITY_LO)

Read-write. Reset: 0000_0000h.

IOHC Egress POISON SEVERITY control bit.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000830; IOHCRAS[1:0]=13[C:B]2_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000830; IOHCRAS[3:2]=13[E:D]2_0000h**Bits Description**

31:0	EgressPoisonSeverityLo. Read-write. Reset: 0000_0000h. Each bit is associated with a logical IOHC Egress port such as a PCIe RC. 1=High Severity 0=Low Severity.
------	---

IOHCRAS[0...3]x00000834 (IOHC::EGRESS_POISON_SEVERITY_HI)

Read-write. Reset: 0000_0000h.

IOHC Egress POISON SEVERITY control bit.

_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00000834; IOHCRAS[1:0]=13[C:B]2_0000h_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00000834; IOHCRAS[3:2]=13[E:D]2_0000h**Bits Description**

31:0	EgressPoisonSeverityHi. Read-write. Reset: 0000_0000h. Each bit is associated with a logical IOHC Egress port such as a PCIe RC. 1=High Severity 0=Low Severity.
------	---

IOHCRAS[0...3]x00000DC0 (IOHC::APML_STATUS)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

[APML](#) Error Status Register[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000DC0; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000DC0; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:7	Reserved.
6	APML_EgressPoisonErrHi. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of a Egress Poison Data High Severity error reported to APML .
5	APML_EgressPoisonErrLo. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of a Egress Poison Data Low Severity error reported to APML .
4	APML_IntPoisonErr. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of a Internal Poison Data error reported to APML .
3	APML_Serr. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of a system error reported to APML .
2	APML_Fatal. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of a fatal error reported to APML .
1	APML_NonFatal. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of a non-fatal error reported to APML .
0	APML_Corr. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of a correctable error reported to APML .

IOHCRAS[0...3]x00000DC4 (IOHC::APML_CONTROL)

Read-write. Reset: 0000_0100h.

[APML](#) Error Control Register.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000DC4; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000DC4; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:9	Reserved.
8	APML_OutputDis. Read-write. Reset: 1. Disable I/O RAS controller from signalling error status to APML . This prevents interrupt generation to SMU.
7:2	Reserved.
1	APML_SyncFlood_En. Read-write. Reset: 0. Enable SDP ErrEvent generation from APML .
0	APML_NMI_En. Read-write. Reset: 0. Enable NMI generation from APML .

IOHCRAS[0...3]x00000DC8 (IOHC::APML_TRIGGER)

Write-only. Reset: 0000_0000h.

[APML](#) TRIGGER Register[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00000DC8; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00000DC8; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:1	Reserved.
0	APML_NMI_TRIGGER. Write-only. Reset: 0. Triggers NMI to the CPU.

IOHCRAS[0...3]x00003004 (IOHC::PSP_SYNCFLOOD_STATUS)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

This register is intended for [PSP](#) usage only`_iohub[1:0]_nbio0_aliasSMN; IOHCRAS[1:0]x00003004; IOHCRAS[1:0]=13[C:B]2_0000h``_iohub[1:0]_nbio1_aliasSMN; IOHCRAS[3:2]x00003004; IOHCRAS[3:2]=13[E:D]2_0000h`

Bits	Description
31	PSPSyncfloodFromIOHCPortN_31. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 23.
30	PSPSyncfloodFromIOHCPortN_30. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 22.
29	PSPSyncfloodFromIOHCPortN_29. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 21.
28	PSPSyncfloodFromIOHCPortN_28. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 20.
27	PSPSyncfloodFromIOHCPortN_27. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 19.
26	PSPSyncfloodFromIOHCPortN_26. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 18.
25	PSPSyncfloodFromIOHCPortN_25. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 17.
24	PSPSyncfloodFromIOHCPortN_24. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 16.
23	PSPSyncfloodFromIOHCPortN_23. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 15.
22	PSPSyncfloodFromIOHCPortN_22. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 14.
21	PSPSyncfloodFromIOHCPortN_21. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 13.
20	PSPSyncfloodFromIOHCPortN_20. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 12.
19	PSPSyncfloodFromIOHCPortN_19. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 11.
18	PSPSyncfloodFromIOHCPortN_18. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 10.
17	PSPSyncfloodFromIOHCPortN_17. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 9.
16	PSPSyncfloodFromIOHCPortN_16. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 8.
15	PSPSyncfloodFromIOHCPortN_15. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 7.
14	PSPSyncfloodFromIOHCPortN_14. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 6.
13	PSPSyncfloodFromIOHCPortN_13. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 5.
12	PSPSyncfloodFromIOHCPortN_12. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 4.
11	PSPSyncfloodFromIOHCPortN_11. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 3.
10	PSPSyncfloodFromIOHCPortN_10. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 2.

9	PSPSyncfloodFromIOHCPortN_9. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 1.
8	PSPSyncfloodFromIOHCPortN_8. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent received from IOHC Port 0.
7:6	Reserved.
5	PSPSyncfloodFromMCA. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by MCA .
4	PSPSyncfloodFromPrivate. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by PSP or SMU via SW_SYNCFLOOD_PRIVATE.
3	Reserved.
2	PSPSyncfloodFromPin. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by the NMI_SYNCFLOOD# pin(LPC_SMI_LNMI_SYNC_FLOOD_L/AGPIO86).
1	PSPSyncfloodFromAPML. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by the APML interface.
0	PSPSyncfloodFromRASCntl. Read,Write-1-to-clear. Reset: Cold,0. This bit indicates the status of an SDP ErrEvent triggered by the I/O RAS controller.

IOHCRAS[0...3]x00003008 (IOHC::PSP_INTERNAL_POISON_STATUS)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

This register is intended for [PSP](#) usage only[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00003008; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00003008; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31:8	Reserved.
7	PSPIntPoisonStatus_7. Read,Write-1-to-clear. Reset: Cold,0. (internal only) Reserved
6	PSPIntPoisonStatus_6. Read,Write-1-to-clear. Reset: Cold,0. (internal only) Reserved
5	PSPIntPoisonStatus_5. Read,Write-1-to-clear. Reset: Cold,0. (internal only) Reserved

3	PSPIntPoisonStatus_3. Read,Write-1-to-clear. Reset: Cold,0. (internal only) Reserved
2	PSPIntPoisonStatus_2. Read,Write-1-to-clear. Reset: Cold,0. (internal only) This bit indicates the status of IOHC consuming poisoned data in the Msg block.
1	PSPIntPoisonStatus_1. Read,Write-1-to-clear. Reset: Cold,0. (internal only) This bit indicates the status of IOHC consuming poisoned data in the Trap block.
0	PSPIntPoisonStatus_0. Read,Write-1-to-clear. Reset: Cold,0. (internal only) This bit indicates the status of IOHC consuming poisoned data in the SMN Master.

IOHCRAS[0...3]x00003010 (IOHC::PSP_EGRESS_POISON_STATUS_LO)

Read,Write-1-to-clear. Reset: Cold,0000_0000h.

This register is intended for [PSP](#) usage only[_iohub\[1:0\]_nbio0_aliasSMN](#); IOHCRAS[1:0]x00003010; IOHCRAS[1:0]=13[C:B]2_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOHCRAS[3:2]x00003010; IOHCRAS[3:2]=13[E:D]2_0000h

Bits	Description
31	PSPEgressPoisonStatusLo_31. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
30	PSPEgressPoisonStatusLo_30. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
29	PSPEgressPoisonStatusLo_29. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
28	PSPEgressPoisonStatusLo_28. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
27	PSPEgressPoisonStatusLo_27. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
26	PSPEgressPoisonStatusLo_26. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
25	PSPEgressPoisonStatusLo_25. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
24	PSPEgressPoisonStatusLo_24. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
23	PSPEgressPoisonStatusLo_23. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
22	PSPEgressPoisonStatusLo_22. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
21	PSPEgressPoisonStatusLo_21. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
20	PSPEgressPoisonStatusLo_20. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
19	PSPEgressPoisonStatusLo_19. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
18	PSPEgressPoisonStatusLo_18. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
17	PSPEgressPoisonStatusLo_17. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.

16	PSPEgressPoisonStatusLo_16. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
15	PSPEgressPoisonStatusLo_15. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
14	PSPEgressPoisonStatusLo_14. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
13	PSPEgressPoisonStatusLo_13. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
12	PSPEgressPoisonStatusLo_12. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
11	PSPEgressPoisonStatusLo_11. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
10	PSPEgressPoisonStatusLo_10. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
9	PSPEgressPoisonStatusLo_9. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
8	PSPEgressPoisonStatusLo_8. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
7	PSPEgressPoisonStatusLo_7. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
6	PSPEgressPoisonStatusLo_6. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
5	PSPEgressPoisonStatusLo_5. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
4	PSPEgressPoisonStatusLo_4. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
3	PSPEgressPoisonStatusLo_3. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
2	PSPEgressPoisonStatusLo_2. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
1	PSPEgressPoisonStatusLo_1. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.
0	PSPEgressPoisonStatusLo_0. Read,Write-1-to-clear. Reset: Cold,0. Each bit is associated with a logical IOHC Egress port such as a PCIe RC and indicates whether the destination port transmitted poisoned write or response data.

Read-write. Reset: 0000_000Fh.

power gate control register

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x00000080; IOAGR[1:0]=15[C:B]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x00000080; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:16	Reserved.
15:14	CFG_FW_PG_EXIT_EN. Read-write. Reset: 0h. 2'x1: enable sending the pwrmgr_int for FW interlock feature, 2'b1x: Enable wakeup tile from power gated state using the pwrmtg_int_clear signal
13:10	CFG_IDLENESS_COUNT_EN. Read-write. Reset: 0h. 0: idleness_counter is disabled, PGMST uses only hysteresis timeout value to enter power gating. Cfg_idleness_count_en > 0: If the internal idleness counter >= Cfg_idleness_count_en, enter power gated state as soon PGSLV becomes idle, without waiting for the hysteresis timeout.
9	Reserved.
8	CFG_PG_EN. Read-write. Reset: 0. enables dynamic power gating
7:0	CFG_PG_HYSTERESIS. Read-write. Reset: 0Fh. controls the number of consecutive periods when all PG IPs assert PGMST_PGSLV_pwrGate_ready before initiating power gating. Each period is 1600ns duration

IOAGR[0...3]x00000084 (IOAGR::IOAGR_PGSLV_CNTL)

Read-write. Reset: 0000_0004h.

power gate control register

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x00000084; IOAGR[1:0]=15[C:B]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x00000084; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:5	Reserved.
4:0	CFG_IDLE_HYSTERESIS. Read-write. Reset: 04h. Hysteresis timer to enter power gating. The counter decrements every 200ns

IOAGR[0...3]x00000088 (IOAGR::IOAGR_RSMU_HCID)

Read-write. Reset: 0002_0000h.

RSMU hardware revision register.

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x00000088; IOAGR[1:0]=15[C:B]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x00000088; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:23	Reserved.
22:16	RSMU_HCID_HwMajVer. Read-write. Reset: 02h. RSMU hardware major revision.
15	Reserved.
14:8	RSMU_HCID_HwMinVer. Read-write. Reset: 00h. RSMU hardware minor revision.
7:6	Reserved.
5:0	RSMU_HCID_HwRev. Read-write. Reset: 00h. RSMU hardware revision.

IOAGR[0...3]x0000008C (IOAGR::IOAGR_RSMU_SIID)

Read-write. Reset: 0002_0000h.

RSMU software revision register.

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x0000008C; IOAGR[1:0]=15[C:B]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x0000008C; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:23	Reserved.
22:16	RSMU_SIID_SwIfMajVer. Read-write. Reset: 02h. RSMU software major revision.
15	Reserved.
14:8	RSMU_SIID_SwIfMinVer. Read-write. Reset: 00h. RSMU software minor revision.
7:6	Reserved.
5:0	RSMU_SIID_SwIfRev. Read-write. Reset: 00h. RSMU software revision.

IOAGR[0...3]x000000AC (IOAGR::IOAGR_HST_ORIG_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x000000AC; IOAGR[1:0]=15[C:B]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x000000AC; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:16	HST_EnableEarlyOrigClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early OrigClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	HST_EnableEarlyOrigClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early OrigClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOAGR[0...3]x000000B0 (IOAGR::IOAGR_DMA_ORIG_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x000000B0; IOAGR[1:0]=15[C:B]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x000000B0; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:16	DMA_EnableEarlyOrigClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early OrigClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	DMA_EnableEarlyOrigClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early OrigClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOAGR[0...3]x000000B4 (IOAGR::IOAGR_NCM_ORIG_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x000000B4; IOAGR[1:0]=15[C:B]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x000000B4; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:16	NCM_EnableEarlyOrigClkReqEgress. Read-write. Reset: 0000h. These bits enable sending early OrigClkReq to clients, bit 0: Client0, bit 1: Client1, etc.
15:0	NCM_EnableEarlyOrigClkReqIngress. Read-write. Reset: 0000h. These bits enable receiving early OrigClkReq from clients, bit 0: Client0, bit 1: Client1, etc.

IOAGR[0...3]x000000B8 (IOAGR::IOAGR_HST_COMP_EARLY_WAKE_UP_EN)

Read-write. Reset: 0000_0000h.

sdp port control register

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x000000B8; IOAGR[1:0]=15[C:B]0_0000h

Bits	Description
31:0	IOAGR_SION_S0_Client_WrRsp_BurstTarget_Lower. Read-write. Reset: 0000_0000h. Description: Lower 32-bit field of BurstTarget[63:0]. Every 8-bits sets number of beats to group together, per VC, per given source client. Bits 7:0 are for VC0, bits 15:8 are for VC1, etc. SION only groups beats if they are available. Value of 0 means no grouping (each cycle is a new arbitration decision).

IOAGR[0...3]x000014A0 (IOAGR::IOAGR_SION_LiveLock_WatchDog_Threshold)

Read-write. Reset: 0000_0014h.

arbitration Threshold

`_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x000014A0; IOAGR[1:0]=15[C:B]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x000014A0; IOAGR[3:2]=15[E:D]0_0000h`

Bits	Description
31:8	Reserved.
7:0	IOAGR_SION_LiveLock_WatchDog_Threshold. Read-write. Reset: 14h. Threshold for number of arbitration losses a request/response has before it's priority is increased above other requestors. Used to prevent deadlocks. A value greater than 0x10 should be given.

IOAGR[0...3]x000014A4 (IOAGR::IOAGR_SION_PERF_CNT_CNTL0)

Reset: 0080_8000h.

IOAGR SION Performance Counters Control Register

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x000014A4; IOAGR[1:0]=15[C:B]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x000014A4; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:24	Reserved.
23	IOAGR_SION_PERF_RESET_DELAY_EN . Read-write. Reset: 1. Enables the Programmable Pulse width for Global Perf Reset Toggle.
22:20	Reserved.
19:16	IOAGR_SION_PERF_RESET_DELAY . Read-write. Reset: 0h. Programmable Pulse width for Global Perf Reset Toggle.
15	IOAGR_SION_SHADOW_DELAY_EN . Read-write. Reset: 1. Enables the Programmable Pulse with for Global Shadow Write Toggle.
14:12	Reserved.
11:8	IOAGR_SION_SHADOW_DELAY . Read-write. Reset: 0h. Programmable Pulse width for Global Shadow Write Toggle.
7:3	Reserved.
2	IOAGR_SION_PERF_RESET . Write-only. Reset: 0. 0=Toggle Global Reset to all Counters. Write 1 for Global RESET of ALL counters. Read back value has no meaning.
1	IOAGR_SION_SHADOW_WR . Write-only. Reset: 0. Write 1 to load the counter shadow registers. Read back value has no meaning.
0	IOAGR_SION_CNT_EN . Read-write. Reset: 0. 0=Stop all counters. 1=Start all counters. Enable Performance Counters.

IOAGR[0...3]x000014A8 (IOAGR::IOAGR_SION_PERF_CNT_CNTL1)

Read-write.

IOAGR SION Performance Counter Control.

_iohub[1:0]_nbio0_aliasSMN; IOAGR[1:0]x000014A8; IOAGR[1:0]=15[C:B]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAGR[3:2]x000014A8; IOAGR[3:2]=15[E:D]0_0000h

Bits	Description
31:24	IOAGR_SION_EVENT3_SEL . Read-write. Counter 3 event select.
23:16	IOAGR_SION_EVENT2_SEL . Read-write. Counter 2 event select.
15:8	IOAGR_SION_EVENT1_SEL . Read-write. Counter 1 event select.
7:0	IOAGR_SION_EVENT0_SEL . Read-write. Counter 0 event select.

Upper 32-bit field of TimeSlot

_iohub0_n[4:0]_nbio0_aliasSMN; SDPMUX0x0000_[14,10,0C,08,04]4C; SDPMUX0=0440_0000h

_iohub0_n[4:0]_nbio1_aliasSMN; SDPMUX1x0000_[14,10,0C,08,04]4C; SDPMUX1=04E0_0000h

Bits	Description
31:0	RdRsp_TimeSlot_Upper. Read-write. Reset: 0000_0000h. Description: Upper 32-bit field of TimeSlot[63:0]. Every 4-bits sets the arbitration decision for a new timeslot, for a total of 16 timeslots, per given destination client. Bits 3:0 are for timeslot 0, Bits 7:4 are for timeslot 1, Bits 11:8 are for timeslot 2, etc. A value of 0 means round-robin, value 1 means choose Source0, value 2 means choose Source1, value 3 means choose Source2, etc. If the winner is not available, round-robin is used to pick a new winner.

**SDPMUX0x00000450...SDPMUX1x00001450
(SDPMUX::SDPMUX_SION_S1_Client_WrRsp_BurstTarget_Lower)**

Read-write. Reset: 0000_0000h.

Lower 32-bit field of BurstTarget

SDPMUX[0...1]x000014A8 (SDPMUX::SDPMUX_SION_PERF_CNT_CNTL1)

Read-write.

SDPMUX SION Performance Counter Control.

_iohub0_nbio[1:0]_aliasSMN; SDPMUX[1:0]x000014A8; SDPMUX[1:0]=04[E,4]0_0000h

Bits	Description
31:24	SDPMUX_SION_EVENT3_SEL . Read-write. Counter 3 event select.
23:16	SDPMUX_SION_EVENT2_SEL . Read-write. Counter 2 event select.
15:8	SDPMUX_SION_EVENT1_SEL . Read-write. Counter 1 event select.
7:0	SDPMUX_SION_EVENT0_SEL . Read-write. Counter 0 event select.

SDPMUX[0...1]x000014AC (SDPMUX::SDPMUX_SION_PERF_COUNT0)

Read-only, Volatile.

SDPMUX SION Performance Counter 0.

_iohub0_nbio[1:0]_aliasSMN; SDPMUX[1:0]x000014AC; SDPMUX[1:0]=04[E,4]0_0000h

Bits	Description
31:0	SDPMUX_SION_COUNTER0 . Read-only, Volatile. Read back value of Counter 0 bit 31:0.

SDPMUX[0...1]x000014B0 (SDPMUX::SDPMUX_SION_PERF_COUNT0_UPPER)

Read-only, Volatile.

SDPMUX SION Performance Counter 0.

_iohub0_nbio[1:0]_aliasSMN; SDPMUX[1:0]x000014B0; SDPMUX[1:0]=04[E,4]0_0000h

Bits	Description
31:24	Reserved.
23:0	SDPMUX_SION_COUNTER0_UPPER . Read-only, Volatile. Read back value of Counter 0 bit 55:32.

SDPMUX[0...1]x000014B4 (SDPMUX::SDPMUX_SION_PERF_COUNT1)

Read-only, Volatile.

SDPMUX SION Performance Counter 1.

_iohub0_nbio[1:0]_aliasSMN; SDPMUX[1:0]x000014B4; SDPMUX[1:0]=04[E,4]0_0000h

Bits Description31:0 **SDPMUX_SION_COUNTER1**. Read-only, Volatile. Read back value of Counter 1 bit 31:0.**SDPMUX[0...1]x000014B8 (SDPMUX::SDPMUX_SION_PERF_COUNT1_UPPER)**

Read-only, Volatile.

SDPMUX SION Performance Counter 1.

13.3 Root Complex Event Collector (RCEC)

13.3.1 Definitions

Table 231: Link Definitions

Term	Description
RCEC	Root Complex Event Collector.

13.3.2 Overview

Each instance of IOHub in the system contains an RCEC. The RCEC is intended to be used to collect [PCIe](#) error messages from CXL™ devices in the system, and optionally report the errors to the processor using MSI or legacy interrupts.

13.3.3 Register Access

The IOHub RCEC features a standard [PCIe](#) header visible on the PCIe topology on Dev0Fn3 of the primary bus of the root complex.

13.3.4 Initialization

The following section describes proprietary registers which must be programmed in the RCEC.

The RCEC needs to be programmed to include the correct bus range containing the CXL™ devices attached to the root complex. This can be the secondary/subordinate bus range of the CXL™ downstream port, contained in the DS RCRB configuration space. The following sequence is needed:

```
IOAPIC::RCEC::RCEC_CFG[HWINIT_WR_LOCK] = 0x0
IOAPIC::RCEC::PCIE_RCECEPA_ASSOCI_NEXTBUS = secondary bus of the CXL™ DS RCRB
IOAPIC::RCEC::PCIE_RCECEPA_ASSOCI_LASTBUS = subordinate bus of the CXL™ DS RCRB
IOAPIC_RCEC::RCEC_CFG[HWINIT_WR_LOCK] = 0x1
```

13.3.5 IOAPIC RCEC Registers

IOAPICRCEC[0...3]x00000000 (IOAPIC::RCEC::VENDOR_ID)	
Read-only. Reset: Fixed,1022h.	
Vendor ID register.	
_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000000; IOAPICRCEC[1:0]=1[A0:9F]0_0000h	
_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000000; IOAPICRCEC[3:2]=1A[2:1]0_0000h	
Bits	Description
15:0	VENDOR_ID. Read-only. Reset: Fixed,1022h. Identifies the manufacturer of the device.

IOAPICRCEC[0...3]x00000002 (IOAPIC::RCEC::DEVICE_ID)

Read-write. Reset: Fixed,14A6h.

Device ID register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000002; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000002; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description15:0 **DEVICE_ID**. Read-write. Reset: Fixed,14A6h. Identifies the particular device.**IOAPICRCEC[0...3]x00000004 (IOAPIC::RCEC::COMMAND_REG)**

Provides control over a function's ability to generate and respond to bus cycles.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000004; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000004; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description

15:11 Reserved.

10 **INT_DIS**. Read-write. Reset: 0. 0=Enable. 1=Disable. Controls the ability of a function to generate INTx interrupt Messages.9 **FAST_B2B_EN**. Read-only. Reset: Fixed,0. Does not apply to PCI Express.8 **SERR_EN**. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to signal upstream, Non-fatal and Fatal errors detected by the function, and the ability of a Port to forward upstream, Non-fatal and Fatal signals received by the Port's secondary interface.7 **AD_STEPPING**. Read-only. Reset: Fixed,0. Does not apply to PCI Express.6 **PARITY_ERROR_RESPONSE**. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to log errors in the Master Data Parity Error bit of the Status register.5 **PAL_SNOOP_EN**. Read-only. Reset: Fixed,0. Does not apply to PCI Express.4 **MEM_WRITE_INVALIDATE_EN**. Read-only. Reset: Fixed,0. Does not apply to PCI Express.3 **SPECIAL_CYCLE_EN**. Read-only. Reset: Fixed,0. Does not apply to PCI Express.2 **BUS_MASTER_EN**. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to issue Memory and I/O Read/Write Requests, and the ability of a Port to forward Memory and I/O Read/Write Requests in the upstream direction.1 **MEM_ACCESS_EN**. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls the ability of a function to accept Memory Space accesses.0 **IO_ACCESS_EN**. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls the ability of a function to accept I/O Space accesses.

IOAPICRCEC[0...3]x00000006 (IOAPIC::RCEC::STATUS)

Read-only.

Used to record status information for bus related events on the primary interface.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000006; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000006; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
15	PARITY_ERROR_DETECTED. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if a function receives a poisoned TLP on the primary interface.
14	SIGNALED_SYSTEM_ERROR. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. For a function with its SERR Enable bit in the Command register set, indicates if the function signals a Non-fatal or Fatal error on the primary interface.
13	RECEIVED_MASTER_ABORT. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if a Requester receives a Completion with Unsupported Request Completion Status on the primary interface.
12	RECEIVED_TARGET_ABORT. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if a Requester receives a Completion with Completer Abort Completion Status on the primary interface.
11	SIGNAL_TARGET_ABORT. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if a function completes a Request using Completer Abort Completion Status on the primary interface.
10:9	DEVSEL_TIMING. Read-only. Reset: Fixed,0h. Does not apply to PCI Express.
8	MASTER_DATA_PARITY_ERROR. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Description: For a Requester with its Parity Error Response bit in the Command register set, indicates if either of the following two conditions occurs on the primary interface: 1) Requester receives a poisoned Completion 2) Requester transmits a poisoned Request. For a Port with its Parity Error Response bit in the Command register set, indicates if either of the following two conditions occurs on the primary interface: 1) Port receives a poisoned Completion going downstream 2) Port transmits a poisoned Request upstream.
7	FAST_BACK_CAPABLE. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
6	Reserved.
5	PCI_66_CAP. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
4	CAP_LIST. Read-only. Reset: Fixed,1. 0=Not Supported. 1=Supported. Indicates the presence of a capability list item.
3	INT_STATUS. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if an INTx interrupt Message is pending internally in the function.
2:1	Reserved.
0	IMMEDIATE_READINESS. Read-only. Reset: Fixed,1. 0=Not Supported. 1=Supported. Indicates if the function is able to successfully complete valid configuration cycles at any time following any type of reset.

IOAPICRCEC[0...3]x00000008 (IOAPIC::RCEC::REVISION_ID)

Read-only. Reset: Fixed,00h.

Indicates a device specific revision identifier.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000008; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000008; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
7:4	MAJOR_REV_ID. Read-only. Reset: Fixed,0h. Indicates major revision identifier.
3:0	MINOR_REV_ID. Read-only. Reset: Fixed,0h. Indicates minor revision identifier.

IOAPICRCEC[0...3]x00000009 (IOAPIC::RCEC::PROG_INTERFACE)

Read-only. Reset: Fixed,00h.

The Programming Interface register is used with the Base Class Code and the Sub-Class Code registers.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000009; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000009; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	PROG_INTERFACE . Read-only. Reset: Fixed,00h. Identifies the specific register-level programming interface of the function, if one is required.

IOAPICRCEC[0...3]x0000000A (IOAPIC::RCEC::SUB_CLASS)

Read-only. Reset: Fixed,07h.

The Sub-Class Code register is used with the Base Class Code and the Programming Interface registers.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000000A; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000000A; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	SUB_CLASS . Read-only. Reset: Fixed,07h. Identifies more specifically the operation of the function.

IOAPICRCEC[0...3]x0000000B (IOAPIC::RCEC::BASE_CLASS)

Read-only. Reset: Fixed,08h.

The Base Class Code register is used with the Sub-Class Code and the Programming Interface registers.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000000B; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000000B; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	BASE_CLASS . Read-only. Reset: Fixed,08h. Identifies broadly the type of operation the function performs.

IOAPICRCEC[0...3]x0000000C (IOAPIC::RCEC::CACHE_LINE)

Read-write. Reset: 00h.

Cache Line Size register.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000000C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000000C; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	CACHE_LINE_SIZE . Read-write. Reset: 00h. Records the system cacheline size in units of DWORDs.

IOAPICRCEC[0...3]x0000000D (IOAPIC::RCEC::LATENCY)

Read-only. Reset: Fixed,00h.

Master Latency Timer register.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000000D; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000000D; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	LATENCY_TIMER . Read-only. Reset: Fixed,00h. Does not apply to PCI Express.

IOAPICRCEC[0...3]x0000000E (IOAPIC::RCEC::HEADER)

Reset: Fixed,80h.

Configuration Space header.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOAPICRCEC[1:0]x0000000E; IOAPICRCEC[1:0]=1[A0:9F]0_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOAPICRCEC[3:2]x0000000E; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
7	DEVICE_TYPE . Read-only. Reset: Fixed,1. 0=Single-Function Device. 1=Multi-Function Device. Identifies if the device contains multiple functions.
6:0	HEADER_TYPE . Read-write. Reset: Fixed,00h. Identifies the layout of the Configuration Space header.
ValidValues:	
Value	Description
00h	Type 0 Header
01h	Type 1 Header
7Fh-02h	Reserved.

IOAPICRCEC[0...3]x0000000F (IOAPIC::RCEC::BIST)

Read-only. Reset: Fixed,00h.

Used for control and status of built-in self tests.

[_iohub\[1:0\]_nbio0_aliasSMN](#); IOAPICRCEC[1:0]x0000000F; IOAPICRCEC[1:0]=1[A0:9F]0_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOAPICRCEC[3:2]x0000000F; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
7	BIST_CAP . Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function supports BIST .
6	BIST_STRT . Read-only. Reset: Fixed,0. If the function supports BIST , initiates the test run, otherwise must be 0.
5:4	Reserved.
3:0	BIST_COMP . Read-only. Reset: Fixed,0h. If the function supports BIST , indicates the test result, otherwise must be 0.

IOAPICRCEC[0...3]x00000010 (IOAPIC::RCEC::BASE_ADDR_1)

Read-only. Reset: Fixed,0000_0000h.

PCI CFG [BAR](#) 1.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOAPICRCEC[1:0]x00000010; IOAPICRCEC[1:0]=1[A0:9F]0_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOAPICRCEC[3:2]x00000010; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	BASE_ADDR . Read-only. Reset: Fixed,0000_0000h. Base Address Register.

IOAPICRCEC[0...3]x00000014 (IOAPIC::RCEC::BASE_ADDR_2)

Read-only. Reset: Fixed,0000_0000h.

PCI CFG [BAR](#) 2.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOAPICRCEC[1:0]x00000014; IOAPICRCEC[1:0]=1[A0:9F]0_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOAPICRCEC[3:2]x00000014; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	BASE_ADDR . Read-only. Reset: Fixed,0000_0000h. Base Address Register.

IOAPICRCEC[0...3]x00000018 (IOAPIC::RCEC::BASE_ADDR_3)

Read-only. Reset: Fixed,0000_0000h.

PCI CFG [BAR](#) 3.[_iohub\[1:0\]_nbio0_aliasSMN](#); IOAPICRCEC[1:0]x00000018; IOAPICRCEC[1:0]=1[A0:9F]0_0000h[_iohub\[1:0\]_nbio1_aliasSMN](#); IOAPICRCEC[3:2]x00000018; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	BASE_ADDR . Read-only. Reset: Fixed,0000_0000h. Base Address Register.

IOAPICRCEC[0...3]x0000001C (IOAPIC::RCEC::BASE_ADDR_4)

Read-only. Reset: Fixed,0000_0000h.

PCI CFG [BAR](#) 4.`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000001C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000001C; IOAPICRCEC[3:2]=1A[2:1]0_0000h`**Bits Description**31:0 **BASE_ADDR.** Read-only. Read-only. Reset: Fixed,0000_0000h.

Cardbus CIS Pointer register.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000028; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000028; IOAPICRCEC[3:2]=1A[2:1]0_0000h`**Bits Description**31:0 **BASE_ADDR.** Read-only. Reset: Fixed,0000_0000h. Does not apply to PCI Express.**IOAPICRCEC[0...3]x0000002C (IOAPIC::RCEC::SSVENDOR_ID)**

Read-only. Reset: Fixed,1022h.

Subsystem Vendor ID register.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000002C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000002C; IOAPICRCEC[3:2]=1A[2:1]0_0000h`**Bits Description**15:0 **SSVENDOR_ID.** Read-only. Reset: Fixed,1022h. Subsystem Vendor ID. Specified by the vendor.**IOAPICRCEC[0...3]x0000002E (IOAPIC::RCEC::SS_ID)**

Read-write.

Subsystem ID register.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000002E; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000002E; IOAPICRCEC[3:2]=1A[2:1]0_0000h`**Bits Description**15:0 **SS_ID.** Read-write. Subsystem ID. Specified by the vendor.

IOAPICRCEC[0...3]x00000030 (IOAPIC::RCEC::ROM_BASE_ADDR)

Read-only. Reset: Fixed,0000_0000h.

PCI CFG Expansion ROM [BAR](#).`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000030; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000030; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
31:0	BASE_ADDR . Read-only. Reset: Fixed,0000_0000h. Expansion ROM Base Address Register.

IOAPICRCEC[0...3]x00000034 (IOAPIC::RCEC::CAP_PTR)

Read-write.

Capability Pointer

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000034; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000034; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	CAP_PTR . Read-write. PMC Capability Pointer

IOAPICRCEC[0...3]x0000003C (IOAPIC::RCEC::INTERRUPT_LINE)

Read-write. Reset: 00h.

Interrupt Line register.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000003C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000003C; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	INTERRUPT_LINE . Read-write. Reset: 00h. Communicates interrupt line routing information.

IOAPICRCEC[0...3]x0000003D (IOAPIC::RCEC::INTERRUPT_PIN)

Read-only. Reset: Fixed,01h.

Interrupt Pin register.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000003D; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000003D; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description														
7:0	INTERRUPT_PIN . Read-only. Reset: Fixed,01h. Identifies the legacy interrupt Message(s) the function uses.														
	ValidValues:														
	<table><tr><th>Value</th><th>Description</th></tr><tr><td>00h</td><td>none</td></tr><tr><td>01h</td><td>INTA</td></tr><tr><td>02h</td><td>INTB</td></tr><tr><td>03h</td><td>INTC</td></tr><tr><td>04h</td><td>INTD</td></tr><tr><td>FFh-05h</td><td>Reserved.</td></tr></table>	Value	Description	00h	none	01h	INTA	02h	INTB	03h	INTC	04h	INTD	FFh-05h	Reserved.
	Value	Description													
	00h	none													
	01h	INTA													
	02h	INTB													
	03h	INTC													
04h	INTD														
FFh-05h	Reserved.														

IOAPICRCEC[0...3]x00000040 (IOAPIC::RCEC::PMI_CAP_LIST)

Power Management Capability header.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000040; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000040; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
15:8	NEXT_PTR . Read-write. Pointer to the next item in the capabilities list, or 00h if no other items exist.
7:0	CAP_ID . Read-only. Reset: Fixed,01h. A PCI-SIG defined ID number that indicates the nature and format of the capability.

IOAPICRCEC[0...3]x00000042 (IOAPIC::RCEC::PMI_CAP)

Read-only. Reset: Fixed,0003h.

Power Management Capabilities register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000042; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000042; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description																		
15:11	PME_SUPPORT. Read-only. Reset: Fixed,00h. Indicates the power states from which the function may generate a PME. This field is a bit vector that covers all Dx states. Bit 0 corresponds to D0.																		
10	D2_SUPPORT. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates support for the D2 power state.																		
9	D1_SUPPORT. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates support for the D1 power state.																		
8:6	AUX_CURRENT. Read-only. Reset: Fixed,0h. Indicates the amount of 3.3Vaux current required to support PME from D3cold.																		
ValidValues:																			
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>0 mA</td></tr> <tr> <td>1h</td><td>55 mA</td></tr> <tr> <td>2h</td><td>100 mA</td></tr> <tr> <td>3h</td><td>160 mA</td></tr> <tr> <td>4h</td><td>220 mA</td></tr> <tr> <td>5h</td><td>270 mA</td></tr> <tr> <td>6h</td><td>320 mA</td></tr> <tr> <td>7h</td><td>375 mA</td></tr> </table>	Value	Description	0h	0 mA	1h	55 mA	2h	100 mA	3h	160 mA	4h	220 mA	5h	270 mA	6h	320 mA	7h	375 mA
Value	Description																		
0h	0 mA																		
1h	55 mA																		
2h	100 mA																		
3h	160 mA																		
4h	220 mA																		
5h	270 mA																		
6h	320 mA																		
7h	375 mA																		
5	DEV_SPECIFIC_INIT. Read-only. Reset: Fixed,0. 0=Not Required. 1=Required. Indicates if the function requires a Device Specific Initialization sequence, upon transition to D0.																		
4	IMMEDIATE_READINESS_ON_RETURN_TO_D0. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function is able to successfully complete valid configuration cycles at any time following return to D0.																		
3	PME_CLOCK. Read-only. Reset: Fixed,0. Does not apply to PCI Express.																		
2:0	VERSION. Read-only. Reset: Fixed,3h. Indicates PCI-SIG defined capability structure version number.																		

IOAPICRCEC[0...3]x00000044 (IOAPIC::RCEC::PMI_STATUS_CNTRL)

Power Management Status/Control register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000044; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000044; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description										
31:16	Reserved.										
15	PME_STATUS . Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if a PME is pending internally in the function.										
14:13	DATA_SCALE . Read-only. Reset: Fixed,0h. Data Scale.										
12:9	DATA_SELECT . Read-only. Reset: Fixed,0h. Data Select.										
8	PME_EN . Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls a function's ability to generate a PME.										
7:4	Reserved.										
3	NO_SOFT_RESET . Read-only. Reset: Fixed,1. 0=Reset on D3hot to D0. 1=No Reset on D3hot to D0. Indicates if the function does not reset on a transition from D3hot to D0.										
2	Reserved.										
1:0	POWER_STATE . Read-write. Reset: 0h. Writes set the function to the written power state. Reads return the function's current power state.										
ValidValues:											
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>D0</td></tr> <tr> <td>1h</td><td>D1</td></tr> <tr> <td>2h</td><td>D2</td></tr> <tr> <td>3h</td><td>D3</td></tr> </table>	Value	Description	0h	D0	1h	D1	2h	D2	3h	D3
Value	Description										
0h	D0										
1h	D1										
2h	D2										
3h	D3										

IOAPICRCEC[0...3]x00000048 (IOAPIC::RCEC::PCIE_CAP_LIST)

PCI Express Capability header.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000048; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000048; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
15:8	NEXT_PTR . Read-write. Pointer to the next item in the capabilities list, or 00h if no other items exist.
7:0	CAP_ID . Read-only. Reset: Fixed,10h. A PCI-SIG defined ID number that indicates the nature and format of the capability.

IOAPICRCEC[0...3]x0000004A (IOAPIC::RCEC::PCIE_CAP)

Read-only. Reset: Fixed,00A2h.

The PCI Express Capabilities register identifies PCI Express device type and associated capabilities.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000004A; IOAPICRCEC[1:0]=1[A0:9F]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000004A; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
15:14	Reserved.
13:9	INT_MESSAGE_NUM. Read-only. Reset: Fixed,00h. Interrupt Message Number.
8	SLOT_IMPLEMENTED. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. For Downstream Ports, indicates if the Link associated with this Port is connected to a slot. For Upstream Ports, this bit is undefined.
7:4	DEVICE_TYPE. Read-only. Reset: Fixed,Ah. Indicates the type of PCI Express device.
ValidValues:	
Value	Description
0h	PCI Express Endpoint
1h	Legacy PCI Express Endpoint
3h-2h	Reserved.
4h	Root Port of PCI Express Root Complex
5h	Upstream Port of PCI Express Switch
6h	Downstream Port of PCI Express Switch
7h	PCI Express to PCI/PCI-X Bridge
8h	PCI/PCI-X to PCI Express Bridge
9h	Root Complex Integrated Endpoint
Ah	Root Complex Event Collector
Fh-Bh	Reserved.
3:0	VERSION. Read-only. Reset: Fixed,2h. Indicates PCI-SIG defined capability structure version number.

IOAPICRCEC[0...3]x0000004C (IOAPIC::RCEC::DEVICE_CAP)

Reset: Fixed,0000_8FE0h.

The Device Capabilities register identifies device specific capabilities.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000004C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000004C; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description																		
31:29	Reserved.																		
28	FLR_CAPABLE. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function supports Function Level Resets.																		
27:26	CAPTURED_SLOT_POWER_SCALE. Read-only. Reset: Fixed,0h. (Upstream Ports only) Indicates the scale used for the Slot Power Limit Value. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>1.0x</td></tr> <tr> <td>1h</td><td>0.1x</td></tr> <tr> <td>2h</td><td>0.01x</td></tr> <tr> <td>3h</td><td>0.001x</td></tr> </table>	Value	Description	0h	1.0x	1h	0.1x	2h	0.01x	3h	0.001x								
Value	Description																		
0h	1.0x																		
1h	0.1x																		
2h	0.01x																		
3h	0.001x																		
25:18	CAPTURED_SLOT_POWER_LIMIT. Read-only. Reset: Fixed,00h. (Upstream Ports only) In combination with the Slot Power Limit Scale value, indicates the upper limit on power supplied by slot.																		
17:16	Reserved.																		
15	ROLE_BASED_ERR_REPORTING. Read-only. Reset: Fixed,1. 0=Not Supported. 1=Supported. Indicates the function implements Role-Based Error Reporting functionality.																		
14:12	Reserved.																		
11:9	L1_ACCEPTABLE_LATENCY. Read-write. Reset: Fixed,7h. Indicates the maximum acceptable latency that an Endpoint can withstand due to the transition from L1 state to L0 state. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>1 us</td></tr> <tr> <td>1h</td><td>2 us</td></tr> <tr> <td>2h</td><td>4 us</td></tr> <tr> <td>3h</td><td>8 us</td></tr> <tr> <td>4h</td><td>16 us</td></tr> <tr> <td>5h</td><td>32 us</td></tr> <tr> <td>6h</td><td>64 us</td></tr> <tr> <td>7h</td><td>No Limit</td></tr> </table>	Value	Description	0h	1 us	1h	2 us	2h	4 us	3h	8 us	4h	16 us	5h	32 us	6h	64 us	7h	No Limit
Value	Description																		
0h	1 us																		
1h	2 us																		
2h	4 us																		
3h	8 us																		
4h	16 us																		
5h	32 us																		
6h	64 us																		
7h	No Limit																		
8:6	L0S_ACCEPTABLE_LATENCY. Read-only. Reset: Fixed,7h. Indicates the maximum acceptable total latency that Endpoint can withstand due to the transition from L0s state to L0 state. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>64 ns</td></tr> <tr> <td>1h</td><td>128 ns</td></tr> <tr> <td>2h</td><td>256 ns</td></tr> <tr> <td>3h</td><td>512 ns</td></tr> <tr> <td>4h</td><td>1 us</td></tr> <tr> <td>5h</td><td>2 us</td></tr> <tr> <td>6h</td><td>4 us</td></tr> <tr> <td>7h</td><td>No Limit</td></tr> </table>	Value	Description	0h	64 ns	1h	128 ns	2h	256 ns	3h	512 ns	4h	1 us	5h	2 us	6h	4 us	7h	No Limit
Value	Description																		
0h	64 ns																		
1h	128 ns																		
2h	256 ns																		
3h	512 ns																		
4h	1 us																		
5h	2 us																		
6h	4 us																		
7h	No Limit																		
5	EXTENDED_TAG. Read-only. Reset: Fixed,1. 0=5-Bit Tag Supported. 1=8-Bit Tag Supported. When 10-Bit Tag Requester Supported bit is clear, indicates the maximum supported size of the Tag field as a Requester.																		

4:3	PHANTOM_FUNC. Read-only. Reset: Fixed,0h. Indicates the support for use of unclaimed function numbers to extend the number of outstanding transactions allowed by logically combining unclaimed function numbers with the Tag identifier.	
	ValidValues:	
	Value	Description
	0h	No Phantom Functions
	1h	1 Phantom Function
	2h	3 Phantom Functions
2:0	3h	7 Phantom Functions
	MAX_PAYLOAD_SUPPORT. Read-only. Reset: Fixed,0h. Indicates the maximum payload size that the function can support for TLPs.	
	ValidValues:	
	Value	Description
	0h	128 Bytes
	1h	256 Bytes
	2h	512 Bytes
	3h	1024 Bytes
	4h	2048 Bytes
	5h	4096 Bytes
	7h-6h	Reserved.

IOAPICRCEC[0...3]x00000050 (IOAPIC::RCEC::DEVICE_CNTL)

The Device Control register controls device specific parameters.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000050; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000050; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description																
15	BRIDGE_CFG_RETRY_EN. Read-write. Reset: Fixed,0. 0=Disable. 1=Enable. Description: (Bridges only) Controls if a PCI Express to PCI/PCI-X Bridge is permitted to return Configuration Retry Status. (Endpoints only) A write of 1 to this bit initiates Function Level Reset to the function. Reads always return 0. For non-Bridges and non-Endpoints this bit is Reserved.																
14:12	MAX_READ_REQUEST_SIZE. Read-only. Reset: Fixed,0h. Controls the maximum Read Request size for the function as a Requester. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>128 Bytes</td></tr> <tr> <td>1h</td><td>256 Bytes</td></tr> <tr> <td>2h</td><td>512 Bytes</td></tr> <tr> <td>3h</td><td>1024 Bytes</td></tr> <tr> <td>4h</td><td>2048 Bytes</td></tr> <tr> <td>5h</td><td>4096 Bytes</td></tr> <tr> <td>7h-6h</td><td>Reserved.</td></tr> </table>	Value	Description	0h	128 Bytes	1h	256 Bytes	2h	512 Bytes	3h	1024 Bytes	4h	2048 Bytes	5h	4096 Bytes	7h-6h	Reserved.
Value	Description																
0h	128 Bytes																
1h	256 Bytes																
2h	512 Bytes																
3h	1024 Bytes																
4h	2048 Bytes																
5h	4096 Bytes																
7h-6h	Reserved.																
11	NO_SNOOP_EN. Read-write. Reset: 1. 0=Disable. 1=Enable. Controls if the function is permitted to set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency.																
10	AUX_POWER_PM_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls if a function is permitted to draw AUX power independent of PME AUX power.																
9	PHANTOM_FUNC_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. When 10-Bit Tag Requester Enable bit is clear, controls if a function is permitted to use unclaimed function numbers as Phantom Functions to extend the number of outstanding transaction identifiers.																
8	EXTENDED_TAG_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. When 10-Bit Tag Requester Enable bit is clear, controls if a function is permitted to use an 8-bit Tag field as a Requester. When both bits are disabled the function is restricted to use a 5-bit Tag field.																
7:5	MAX_PAYLOAD_SIZE. Read-only. Reset: Fixed,0h. Controls the maximum TLP payload size for the function. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>128 Bytes</td></tr> <tr> <td>1h</td><td>256 Bytes</td></tr> <tr> <td>2h</td><td>512 Bytes</td></tr> <tr> <td>3h</td><td>1024 Bytes</td></tr> <tr> <td>4h</td><td>2048 Bytes</td></tr> <tr> <td>5h</td><td>4096 Bytes</td></tr> <tr> <td>7h-6h</td><td>Reserved.</td></tr> </table>	Value	Description	0h	128 Bytes	1h	256 Bytes	2h	512 Bytes	3h	1024 Bytes	4h	2048 Bytes	5h	4096 Bytes	7h-6h	Reserved.
Value	Description																
0h	128 Bytes																
1h	256 Bytes																
2h	512 Bytes																
3h	1024 Bytes																
4h	2048 Bytes																
5h	4096 Bytes																
7h-6h	Reserved.																
4	RELAXED_ORD_EN. Read-write. Reset: 1. 0=Disable. 1=Enable. Controls if the function is permitted to set the Relaxed Ordering bit in the Attributes field of transactions it initiates that do not require strong write ordering.																
3	USR_REPORT_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of Unsupported Requests.																
2	FATAL_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of Fatal errors.																
1	NON_FATAL_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of Non-fatal errors.																
0	CORR_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of correctable errors.																

IOAPICRCEC[0...3]x00000052 (IOAPIC::RCEC::DEVICE_STATUS)

The Device Status register provides information about device specific parameters.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000052; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000052; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
15:6	Reserved.
5	TRANSACTIONS_PEND. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function has issued Non-Posted Requests, on its own behalf, which have not been completed.
4	AUX_PWR. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Functions that require AUX power report this bit as set if AUX power is detected by the function.
3	USR_DETECTED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the function received an Unsupported Request.
2	FATAL_ERR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates status of Fatal errors detected.
1	NON_FATAL_ERR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates status of Non-fatal errors detected.
0	CORR_ERR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates status of correctable errors detected.

IOAPICRCEC[0...3]x00000064 (IOAPIC::RCEC::ROOT_CNTRL)

The Root Control register controls Root Complex specific parameters.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000064; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000064; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
15:5	Reserved.
4	CRS_SOFTWARE_VISIBILITY_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls if the Root Port returns Configuration Request Retry Status Completion Status to software.
3	PM_INTERRUPT_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls interrupt generation upon receipt of a PME Message.
2	SERR_ON_FATAL_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if a System Error should be generated if a Fatal error is reported by any of the devices in the hierarchy associated with this Root Port.
1	SERR_ON_NONFATAL_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if a System Error should be generated if a Non-fatal error is reported by any of the devices in the hierarchy associated with this Root Port.
0	SERR_ON_CORR_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if a System Error should be generated if a correctable error is reported by any of the devices in the hierarchy associated with this Root Port.

IOAPICRCEC[0...3]x00000068 (IOAPIC::RCEC::ROOT_STATUS)

Reset: 0000_0000h.

The Root Status register provides information about device specific parameters.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000068; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000068; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:18	Reserved.
17	PME_PENDING. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if another PME is pending when the PME Status bit is set. Hardware clears this bit when no more PMEs are pending.
16	PME_STATUS. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if PME was asserted by the PME Requester indicated in the PME Requestor ID field.
15:0	PME_REQUESTOR_ID. Read-only. Reset: 0000h. When PME Status is set, indicates the Requester ID of the PME Requester.

IOAPICRCEC[0...3]x00000084 (IOAPIC::RCEC::MSI_CAP_LIST)

Message Signaled Interrupt Capability header.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000084; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000084; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
15:8	NEXT_PTR. Read-write. Pointer to the next item in the capabilities list, or 00h if no other items exist.
7:0	CAP_ID. Read-only. Reset: Fixed,05h. A PCI-SIG defined ID number that indicates the nature and format of the capability.

IOAPICRCEC[0...3]x00000086 (IOAPIC::RCEC::MSI_MSG_CNTL)

Message Signaled Interrupt Control register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000086; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000086; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description																
15:11	Reserved.																
10	MSI_EXTENDEDMSG_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Indicates to support Extended Message Data.																
9	MSI_EXTENDEDMSG_CAP. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function supports Extended Message Data.																
8	MSI_PERVECTOR_MASKING_CAP. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function supports MSI per-vector masking.																
7	MSI_64BIT. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function supports generating 64-bit message addresses.																
6:4	MSI_MULTI_EN. Read-write. Reset: 0h. Controls the number of MSI vectors that the function is permitted to use. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>1 Vector Allocated</td></tr> <tr> <td>1h</td><td>2 Vectors Allocated</td></tr> <tr> <td>2h</td><td>4 Vectors Allocated</td></tr> <tr> <td>3h</td><td>8 Vectors Allocated</td></tr> <tr> <td>4h</td><td>16 Vectors Allocated</td></tr> <tr> <td>5h</td><td>32 Vectors Allocated</td></tr> <tr> <td>7h-6h</td><td>Reserved.</td></tr> </table>	Value	Description	0h	1 Vector Allocated	1h	2 Vectors Allocated	2h	4 Vectors Allocated	3h	8 Vectors Allocated	4h	16 Vectors Allocated	5h	32 Vectors Allocated	7h-6h	Reserved.
Value	Description																
0h	1 Vector Allocated																
1h	2 Vectors Allocated																
2h	4 Vectors Allocated																
3h	8 Vectors Allocated																
4h	16 Vectors Allocated																
5h	32 Vectors Allocated																
7h-6h	Reserved.																
3:1	MSI_MULTI_CAP. Read-only. Reset: Fixed,0h. Indicates the number of MSI vectors that the function can support. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>1 Vector Supported</td></tr> <tr> <td>1h</td><td>2 Vectors Supported</td></tr> <tr> <td>2h</td><td>4 Vectors Supported</td></tr> <tr> <td>3h</td><td>8 Vectors Supported</td></tr> <tr> <td>4h</td><td>16 Vectors Supported</td></tr> <tr> <td>5h</td><td>32 Vectors Supported</td></tr> <tr> <td>7h-6h</td><td>Reserved.</td></tr> </table>	Value	Description	0h	1 Vector Supported	1h	2 Vectors Supported	2h	4 Vectors Supported	3h	8 Vectors Supported	4h	16 Vectors Supported	5h	32 Vectors Supported	7h-6h	Reserved.
Value	Description																
0h	1 Vector Supported																
1h	2 Vectors Supported																
2h	4 Vectors Supported																
3h	8 Vectors Supported																
4h	16 Vectors Supported																
5h	32 Vectors Supported																
7h-6h	Reserved.																
0	MSI_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to generate MSI requests.																

IOAPICRCEC[0...3]x00000088 (IOAPIC::RCEC::MSI_MSG_ADDR)

Read-write. Reset: 0000_0000h.

Message Address register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000088; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000088; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description31:2 **MSI_MSG_ADDR**. Read-write. Reset: 0000_0000h. Bits 31-2 for MSI address.

1:0 Reserved.

IOAPICRCEC[0...3]x0000008C (IOAPIC::RCEC::MSI_MSG_DATA)

Read-write. Reset: 0000h.

Message Data register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000008C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000008C; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description15:0 **MSI_DATA**. Read-write. Reset: 0000h. 16 bits for Message Data.**IOAPICRCEC[0...3]x00000090 (IOAPIC::RCEC::SSID_CAP_LIST)**

Subsystem ID Capability header.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000090; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000090; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description15:8 **NEXT_PTR**. Read-write. Pointer to the next item in the capabilities list, or 00h if no other items exist.7:0 **CAP_ID**. Read-only. Reset: Fixed,0Dh. A PCI-SIG defined ID number that indicates the nature and format of the capability.**IOAPICRCEC[0...3]x00000094 (IOAPIC::RCEC::SSID_CAP_VID)**

Read-only. Reset: Fixed,1022h.

Subsystem ID Capability register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000094; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000094; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description15:0 **SUBSYSTEM_VENDOR_ID**. Read-only. Reset: Fixed,1022h. Subsystem Vendor ID. Specified by the vendor.**IOAPICRCEC[0...3]x00000096 (IOAPIC::RCEC::SSID_CAP_SSID)**

Read-write.

Subsystem ID Capability register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000096; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000096; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description15:0 **SSID_CAP_SSID**. Read-write. Subsystem ID. Specified by the vendor.**IOAPICRCEC[0...3]x00000098 (IOAPIC::RCEC::MSI_MAP_CAP_LIST)**

MSI Mapping Capability header.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000098; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000098; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits Description15:8 **NEXT_PTR**. Read-write. Pointer to the next item in the capabilities list, or 00h if no other items exist.7:0 **CAP_ID**. Read-only. Reset: Fixed,08h. A PCI-SIG defined ID number that indicates the nature and format of the capability.

IOAPICRCEC[0...3]x0000009A (IOAPIC::RCEC::MSI_MAP_CAP)

Read-only. Reset: Fixed,A803h.

MSI Mapping Capability register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000009A; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000009A; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
15:11	CAP_TYPE. Read-only. Reset: Fixed,15h. Indicates this as the MSI Mapping Capability block.
10:2	Reserved.
1	FIXD. Read-only. Reset: Fixed,1. 0=Not Supported. 1=Supported. Indicates if the function supports a fixed MSI mapping at 0xFEExxxxx.
0	EN. Read-only. Reset: Fixed,1. 0=Disable. 1=Enable. Controls if the MSI mapping is active.

IOAPICRCEC[0...3]x00000100 (IOAPIC::RCEC::PCIE_VENDOR_SPECIFIC_ENH_CAP_LIST)

Vendor-Specific Extended Capability header.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000100; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000100; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:20	NEXT_PTR. Read-write. Contains the offset to the next PCI Express capability structure or 000h if no other items exist.
19:16	CAP_VER. Read-only. Reset: Fixed,1h. A PCI-SIG defined version number that indicates the version of the capability structure.
15:0	CAP_ID. Read-only. Reset: Fixed,000Bh. A PCI-SIG defined ID number that indicates the nature and format of the extended capability.

IOAPICRCEC[0...3]x00000104 (IOAPIC::RCEC::PCIE_VENDOR_SPECIFIC_HDR)

Read-only. Reset: Fixed,0101_0001h.

Vendor Specific Header register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000104; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000104; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:20	VSEC_LENGTH. Read-only. Reset: Fixed,010h. Number of bytes in the entire VSEC structure.
19:16	VSEC_REV. Read-only. Reset: Fixed,1h. Vendor-defined revision number.
15:0	VSEC_ID. Read-only. Reset: Fixed,0001h. Vendor-defined ID number.

IOAPICRCEC[0...3]x00000108 (IOAPIC::RCEC::PCIE_VENDOR_SPECIFIC_SCRATCH0)

Read-write. Reset: 0000_0000h.

Vendor-Specific Scratch 0 register

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000108; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000108; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	SCRATCH. Read-write. Reset: 0000_0000h. PCIE scratch 0 register.

IOAPICRCEC[0...3]x0000010C (IOAPIC::RCEC::PCIE_VENDOR_SPECIFIC_SCRATCH1)

Read-write. Reset: 0000_0000h.

Vendor-Specific Scratch 1 register

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000010C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000010C; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	SCRATCH. Read-write. Reset: 0000_0000h. PCIE scratch 1 register.

IOAPICRCEC[0...3]x00000110 (IOAPIC::RCEC::PCIE_ADV_ERR_RPT_ENH_CAP_LIST)

Advanced Error Reporting Extended Capability header.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000110; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000110; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:20	NEXT_PTR. Read-write. Contains the offset to the next PCI Express capability structure or 000h if no other items exist.
19:16	CAP_VER. Read-only. Reset: Fixed,2h. A PCI-SIG defined version number that indicates the version of the capability structure.
15:0	CAP_ID. Read-only. Reset: Fixed,0001h. A PCI-SIG defined ID number that indicates the nature and format of the extended capability.

IOAPICRCEC[0...3]x00000114 (IOAPIC::RCEC::PCIE_UNCORR_ERR_STATUS)

Read-only. Reset: Fixed,0000_0000h.

The Uncorrectable Error Status register reports error status of individual uncorrectable errors in a function.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000114; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000114; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:21	Reserved.
20	UNSUPP_REQ_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects an Unsupported Request Error.
19	ECRC_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects an ECRC Error.
18	MAL_TLP_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Malformed TLP Error.
17	RCV_OVFL_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Receiver Overflow Error.
16	UNEXP_CPL_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects an Unexpected Completion Error.
15	CPL_ABORT_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Completer Abort Error.
14	CPL_TIMEOUT_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Completion Timeout Error.
13	FC_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Flow Control Protocol Error.
12	PSN_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Poisoned TLP Received Error. This bit is sticky.
11:6	Reserved.
5	SURPDN_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Surprise Down Error.
4	DLP_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Data Link Protocol Error. This bit is sticky.
3:1	Reserved.
0	TRAINING_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates a link training error.

IOAPICRCEC[0...3]x00000118 (IOAPIC::RCEC::PCIE_UNCORR_ERR_MASK)

Read-only. Reset: Fixed,0000_0000h.

The Uncorrectable Error Mask register controls reporting of individual uncorrectable errors by a function.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000118; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000118; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:21	Reserved.
20	UNSUPP_REQ_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report an Unsupported Request Error.
19	ECRC_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report an ECRC Error.
18	MAL_TLP_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Malformed TLP Error.
17	RCV_OVFL_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Receiver Overflow Error.
16	UNEXP_CPL_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report an Unexpected Completion Error.
15	CPL_ABORT_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Completer Abort Error.
14	CPL_TIMEOUT_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Completion Timeout Error.
13	FC_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Flow Control Protocol Error.
12	PSN_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Poisoned TLP Received Error.
11:6	Reserved.
5	SURPDN_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Surprise Down Error.
4	DLP_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Data Link Protocol Error.
3:1	Reserved.
0	TRAINING_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if a link could report a training error.

IOAPICRCEC[0...3]x0000011C (IOAPIC::RCEC::PCIE_UNCORR_ERR_SEVERITY)

Read-only. Reset: Fixed,0000_0000h.

The Uncorrectable Error Severity register controls whether an individual uncorrectable error is reported by a function as a Non-fatal or Fatal error.

`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000011C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000011C; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
31:21	Reserved.
20	UNSUPP_REQ_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports an Unsupported Request Error.
19	ECRC_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports an ECRC Error.
18	MAL_TLP_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Malformed TLP Error.
17	RCV_OVFL_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Receiver Overflow Error.
16	UNEXP_CPL_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports an Unexpected Completion Error.
15	CPL_ABORT_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Completer Abort Error.
14	CPL_TIMEOUT_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Completion Timeout Error.
13	FC_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Flow Control Protocol Error.
12	PSN_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Poisoned TLP Received Error.
11:6	Reserved.
5	SURPDN_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Surprise Down Error.
4	DLP_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how the function reports a Data Link Protocol Error.
3:1	Reserved.
0	TRAINING_ERR_SEVERITY . Read-only. Reset: Fixed,0. 0=Non-fatal. 1=Fatal. Controls how a link reports a training error.

IOAPICRCEC[0...3]x00000120 (IOAPIC::RCEC::PCIE_CORR_ERR_STATUS)

Read-only. Reset: Fixed,0000_0000h.

The Correctable Error Status register reports error status of individual correctable errors in a function.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000120; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000120; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:14	Reserved.
13	ADVISORY_NONFATAL_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects an Advisory Non-Fatal Error. This bit is sticky.
12	REPLAY_TIMER_TIMEOUT_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Replay Timer Timeout Error. This bit is sticky.
11:9	Reserved.
8	REPLAY_NUM_ROLLOVER_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a REPLAY_NUM Rollover Error. This bit is sticky.
7	BAD_DLLP_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Bad DLLP Error. This bit is sticky.
6	BAD_TLP_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Bad TLP Error. This bit is sticky.
5:1	Reserved.
0	RCV_ERR_STATUS. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. Indicates if the function detects a Receiver Error.

IOAPICRCEC[0...3]x00000124 (IOAPIC::RCEC::PCIE_CORR_ERR_MASK)

Read-only. Reset: Fixed,0000_2000h.

The Correctable Error Mask register controls reporting of individual correctable errors by a function.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000124; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000124; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:14	Reserved.
13	ADVISORY_NONFATAL_ERR_MASK. Read-only. Reset: Fixed,1. 0=Unmasked. 1=Masked. Controls if the function can report an Advisory Non-Fatal Error.
12	REPLAY_TIMER_TIMEOUT_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Replay Timer Timeout Error.
11:9	Reserved.
8	REPLAY_NUM_ROLLOVER_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a REPLAY_NUM Rollover Error.
7	BAD_DLLP_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Bad DLLP Error.
6	BAD_TLP_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Bad TLP Error.
5:1	Reserved.
0	RCV_ERR_MASK. Read-only. Reset: Fixed,0. 0=Unmasked. 1=Masked. Controls if the function can report a Receiver Error.

IOAPICRCEC[0...3]x00000128 (IOAPIC::RCEC::PCIE_ADV_ERR_CAP_CNTL)

Read-only. Reset: Fixed,0000_0000h.

Advanced Error Capabilities and Control register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000128; IOAPICRCEC[1:0]=1[A0:9F]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000128; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:13	Reserved.
12	COMPLETION_TIMEOUT_LOG_CAPABLE. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function is capable of recording the TLP Prefix (if any) and the Header for the TLP corresponding to a detected Completion Timeout error.
11	TLP_PREFIX_LOG_PRESENT. Read-only. Reset: Fixed,0. 0=Not Detected. 1=Detected. When the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. This bit is sticky. If End-End TLP Prefix Supported bit is not set, this bit is Reserved.
10	MULTI_HDR_RECD_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls if the function is permitted to record more than one error header.
9	MULTI_HDR_RECD_CAP. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function is capable of recording more than one error header.
8	ECRC_CHECK_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls if the function checks ECRC. This bit is sticky.
7	ECRC_CHECK_CAP. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function is capable of checking ECRC.
6	ECRC_GEN_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls if the function generates ECRC. This bit is sticky.
5	ECRC_GEN_CAP. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if the function is capable of generating ECRC.
4:0	FIRST_ERR_PTR. Read-only. Reset: Fixed,00h. Indicates the bit position of the first error reported in the Uncorrectable Error Status register. This field is only valid if the indicated bit is also set. This field is sticky.

IOAPICRCEC[0...3]x0000012C (IOAPIC::RCEC::PCIE_HDR_LOG0)

Read-only. Reset: Fixed,0000_0000h.

Header Log register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000012C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000012C; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_HDR. Read-only. Reset: Fixed,0000_0000h. TLP Header 1st DW captures the first DW of the Header for the TLP corresponding to a detected error.

IOAPICRCEC[0...3]x00000130 (IOAPIC::RCEC::PCIE_HDR_LOG1)

Read-only. Reset: Fixed,0000_0000h.

Header Log register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000130; IOAPICRCEC[1:0]=1[A0:9F]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000130; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_HDR. Read-only. Reset: Fixed,0000_0000h. TLP Header 2nd DW captures the first DW of the Header for the TLP corresponding to a detected error.

IOAPICRCEC[0...3]x00000134 (IOAPIC::RCEC::PCIE_HDR_LOG2)

Read-only. Reset: Fixed,0000_0000h.

Header Log register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000134; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000134; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_HDR. Read-only. Reset: Fixed,0000_0000h. TLP Header 3rd DW captures the first DW of the Header for the TLP corresponding to a detected error.

IOAPICRCEC[0...3]x00000138 (IOAPIC::RCEC::PCIE_HDR_LOG3)

Read-only. Reset: Fixed,0000_0000h.

Header Log register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000138; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000138; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_HDR. Read-only. Reset: Fixed,0000_0000h. TLP Header 4th DW captures the first DW of the Header for the TLP corresponding to a detected error.

IOAPICRCEC[0...3]x0000013C (IOAPIC::RCEC::PCIE_ROOT_ERR_CMD)

Read-write. Reset: 0000_0000h.

Root Error Command register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000013C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000013C; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:3	Reserved.
2	FATAL_ERR_REP_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the generation of an interrupt when a Fatal error is reported by any of the devices in the hierarchy associated with this Root Port.
1	NONFATAL_ERR_REP_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the generation of an interrupt when a Non-fatal error is reported by any of the devices in the hierarchy associated with this Root Port.
0	CORR_ERR_REP_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the generation of an interrupt when a correctable error is reported by any of the devices in the hierarchy associated with this Root Port.

IOAPICRCEC[0...3]x00000140 (IOAPIC::RCEC::PCIE_ROOT_ERR_STATUS)

Root Error Status register.

_johub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000140; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000140; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:27	ADV_ERR_INT_MSG_NUM. Read-only. Reset: Fixed,00h. Indicates the MSI/MSI-X vector used for interrupts generated in association with any of the status bits in the AER capability structure.
26:7	Reserved.
6	FATAL_ERROR_MSG_RCVD. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if one or more Fatal Uncorrectable error Messages have been received. This bit is sticky.
5	NONFATAL_ERROR_MSG_RCVD. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if one or more Non-Fatal Uncorrectable error Messages have been received. This bit is sticky.
4	FIRST_UNCORRECTABLE_FATAL. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the first Uncorrectable error Message received is for a Fatal error. This bit is sticky.
3	MULT_ERR_FATAL_NONFATAL_RCVD. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if either a Fatal or a Non-fatal error is received and ERR_FATAL/NONFATAL Received is already set. This bit is sticky.
2	ERR_FATAL_NONFATAL_RCVD. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if either a Fatal or a Non-fatal error Message is received and this bit is not already set. This bit is sticky.
1	MULT_ERR_CORR_RCVD. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a correctable error Message is received and ERR_COR Received is already set. This bit is sticky.
0	ERR_CORR_RCVD. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a correctable error Message is received and this bit is not already set. This bit is sticky.

IOAPICRCEC[0...3]x00000144 (IOAPIC::RCEC::PCIE_ERR_SRC_ID)

Read-only. Reset: 0000_0000h.

The Error Source Identification register identifies the source (Requester ID) of first correctable and uncorrectable (Non-fatal/Fatal) errors reported in the Root Error Status register.

_johub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000144; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000144; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:16	ERR_FATAL_NONFATAL_SRC_ID. Read-only. Reset: 0000h. Indicates the Requester ID indicated in the received ERR_FATAL or ERR_NONFATAL Message when the ERR_FATAL/NONFATAL Received bit is not already set. This field is sticky.
15:0	ERR_CORR_SRC_ID. Read-only. Reset: 0000h. Indicates the Requester ID indicated in the received ERR_CORR Message when the ERR_CORR Received bit is not already set. This field is sticky.

IOAPICRCEC[0...3]x00000148 (IOAPIC::RCEC::PCIE_TLP_PREFIX_LOG0)

Read-only. Reset: Fixed,0000_0000h.

TLP Prefix Log register.

_johub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000148; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000148; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_PREFIX. Read-only. Reset: Fixed,0000_0000h. First TLP Prefix Log (if supported) captures the first End-End TLP Prefix (if present) for the TLP corresponding to the detected error.

IOAPICRCEC[0...3]x0000014C (IOAPIC::RCEC::PCIE_TLP_PREFIX_LOG1)

Read-only. Reset: Fixed,0000_0000h.

TLP Prefix Log register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000014C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000014C; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_PREFIX. Read-only. Reset: Fixed,0000_0000h. Second TLP Prefix Log (if supported) captures the second End-End TLP Prefix (if present) for the TLP corresponding to the detected error.

IOAPICRCEC[0...3]x00000150 (IOAPIC::RCEC::PCIE_TLP_PREFIX_LOG2)

Read-only. Reset: Fixed,0000_0000h.

TLP Prefix Log register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000150; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000150; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_PREFIX. Read-only. Reset: Fixed,0000_0000h. Third TLP Prefix Log (if supported) captures the third End-End TLP Prefix (if present) for the TLP corresponding to the detected error.

IOAPICRCEC[0...3]x00000154 (IOAPIC::RCEC::PCIE_TLP_PREFIX_LOG3)

Read-only. Reset: Fixed,0000_0000h.

TLP Prefix Log register.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000154; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000154; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	TLP_PREFIX. Read-only. Reset: Fixed,0000_0000h. Fourth TLP Prefix Log (if supported) captures the fourth End-End TLP Prefix (if present) for the TLP corresponding to the detected error.

IOAPICRCEC[0...3]x00000158 (IOAPIC::RCEC::PCIE_RCECEPA_ENH_CAP_LIST)

Root Complex Event Collector Endpoint Association Extended Capability header.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000158; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000158; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:20	NEXT_PTR. Read-write. Contains the offset to the next PCI Express capability structure or 000h if no other items exist.
19:16	CAP_VER. Read-only. Reset: Fixed,2h. A PCI-SIG defined version number that indicates the version of the capability structure.
15:0	CAP_ID. Read-only. Reset: Fixed,0007h. A PCI-SIG defined ID number that indicates the nature and format of the extended capability.

IOAPICRCEC[0...3]x0000015C (IOAPIC::RCEC::PCIE_RCECEPA_ASSOCI_BITMAP)

Read-write.

Association Bitmap.

_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x0000015C; IOAPICRCEC[1:0]=1[A0:9F]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x0000015C; IOAPICRCEC[3:2]=1A[2:1]0_0000h

Bits	Description
31:0	ASSOCI_BITMAP. Read-write. A bitmap indicating which Root Complex Integrated Endpoints (devices) on the same logical bus as the Event Collector itself are supported by the Event Collector.

IOAPICRCEC[0...3]x00000161 (IOAPIC::RCEC::PCIE_RCECEPA_ASSOCI_NEXTBUS)

Read-write.

RCEC Bus Range`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000161; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000161; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	NEXT_BUS . Read-write. RCEC Next Bus

IOAPICRCEC[0...3]x00000162 (IOAPIC::RCEC::PCIE_RCECEPA_ASSOCI_LASTBUS)

Read-write.

RCEC Bus Range`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00000162; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00000162; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
7:0	LAST_BUS . Read-write. RCEC Last Bus

IOAPICRCEC[0...3]x00001000 (IOAPIC::RCEC::RCEC_CFG)

Read-write. Reset: 0000_0032h.

RCEC Configuration Register`_iohub[1:0]_nbio0_aliasSMN; IOAPICRCEC[1:0]x00001000; IOAPICRCEC[1:0]=1[A0:9F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICRCEC[3:2]x00001000; IOAPICRCEC[3:2]=1A[2:1]0_0000h`

Bits	Description
31:7	Reserved.
6:4	FUNC_NUM . Read-write. Reset: 3h. Controls the function number of this RCEC.
3:2	Reserved.
1	HWINIT_WR_LOCK . Read-write. Reset: 1. 0=HwInit fields are writable. 1=HwInit fields are read-only. Controls if HwInit fields are read-only.
0	SYSERR_DISABLE . Read-write. Reset: 0. 0=Enable. 1=Disable. Control whether to generate system error or not.

13.4 IOAPIC

13.4.1 Overview

Each instance of IOHub in the system contains an IOAPIC, separate from the IOAPIC in the [FCH](#). When the system is in APIC mode, the IOHub IOAPIC services legacy INTx interrupts from the [PCIe](#) root complex ports on the same node. When the system is in PIC mode, legacy INTx interrupts flow through the mapping logic at the front end of the IOHub IOAPIC and are then redirected to the PIC in the FCH.

13.4.2 Register Access

The IOHub IOAPIC features a standard set of IOAPIC [MMIO](#) registers. The MMIO aperture is controlled by the IOHC. Proprietary control registers are accessed through the various [SMN](#) access methods such as SMN_INDEX/SMN_DATA.

13.4.3 Initialization

Many of the IOHC registers needed to control address decoding and transaction routing are standard PCI-PCI bridge registers associated with each of the PCI Express root ports. Standard PCI enumeration routines may be used to initialize these registers. The following sections describe additional proprietary registers which must be programmed prior to PCI enumeration.

13.4.3.1 IOAPIC Initialization

The configuration of the IOAPIC [MMIO](#) base address is described in 13.2.4.1 [Configuring Non-PCI Resources].

The IOAPIC has up to a total of 90 interrupt inputs grouped as 5 interrupts per [PCIe](#) root complex bridge. Each root complex bridge supports 4 interrupts corresponding to INT A/B/C/D from the PCIe link and an additional interrupt from the bridge itself to support features like PME and AER.

Interrupt inputs are swizzled and mapped onto one of 32 IOAPIC redirection table entries. The recommended interrupt routing and swizzling configuration is shown in the table below for each logical bridge. Additional information about logical bridge numbering and its association with the root port bus/device/function number is covered in 13.2.4.3 [Bridge Device/Function Remapping].

Table 232: Recommended Interrupt Routing and Swizzling

Logical Bridge Number	Register	Setting	Description
0	Br0_ext_Intr_grp	0x0	Map INT A/B/C/D to redirection table entries 0/1/2/3. Map bridge interrupt to redirection table entry 0.
	Br0_ext_Intr_swz	0x0	
	Br0_ext_int_map	0x0	
1	Br1_ext_Intr_grp	0x1	Map INT A/B/C/D to redirection table entries 4/5/6/7. Map bridge interrupt to redirection table entry 0.

13.4.3.2 PIC Mode

When the system is in PIC mode, INTx interrupts are still mapped onto the 32 redirection table entries of the IOAPIC. These are then reduced modulo 8 onto 8 interrupts (INT A-H) that are forwarded to the PIC in the [FCH](#).

In a multi-node system the INT A-H interrupts are sent from each node and are logically ORed together before being sent to FCH. No swizzling is performed between the IOAPIC and the PIC.

13.4.4 IOAPIC Registers

IOAPICMMIO[0...3]x00000000 (IOAPIC::IOAPICMIO_INDEX)

Read-write. Reset: 0000_0000h.

Index registers for IOAPIC MIO Indirect space

`_iohub[1:0]_nbio0_aliasSMN; IOAPICMMIO[1:0]x00000000; IOAPICMMIO[1:0]=02[9:8]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICMMIO[3:2]x00000000; IOAPICMMIO[3:2]=02[B:A]0_0000h``_iohub0_nbio0_aliasHOST; IOAPICMMIO0x00; IOAPICMMIO0={IOHC::IOAPIC_BASE_ADDR_HI_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_HI], IOHC::IOAPIC_BASE_ADDR_LO_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_LO], 00h}``_iohub1_nbio0_aliasHOST; IOAPICMMIO1x00; IOAPICMMIO1={IOHC::IOAPIC_BASE_ADDR_HI_iohub1_nbio1_aliasSMN[IOAPIC_BASE_ADDR_HI], IOHC::IOAPIC_BASE_ADDR_LO_iohub1_nbio1_aliasSMN[IOAPIC_BASE_ADDR_LO], 00h}`

Bits	Description
31:0	IOAPICMIO_INDEX_data. Read-write. Reset: 0000_0000h. Index registers for IOAPIC MIO Indirect space.

IOAPICMMIO[0...3]x00000010 (IOAPIC::IOAPICMIO_DATA)

Read-write. Reset: 0000_0000h.

Data registers for IOAPIC MIO Indirect space

`_iohub[1:0]_nbio0_aliasSMN; IOAPICMMIO[1:0]x00000010; IOAPICMMIO[1:0]=02[9:8]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICMMIO[3:2]x00000010; IOAPICMMIO[3:2]=02[B:A]0_0000h``_iohub0_nbio0_aliasHOST; IOAPICMMIO0x10; IOAPICMMIO0={IOHC::IOAPIC_BASE_ADDR_HI_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_HI] , IOHC::IOAPIC_BASE_ADDR_LO_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_LO] , 00h}``_iohub1_nbio0_aliasHOST; IOAPICMMIO1x10; IOAPICMMIO1={IOHC::IOAPIC_BASE_ADDR_HI_iohub1_nbio1_aliasSMN[IOAPIC_BASE_ADDR_HI] , IOHC::IOAPIC_BASE_ADDR_LO_iohub1_nbio0_aliasSMN[IOAPIC_BASE_ADDR_LO] , 00h}`

Bits	Description
31:0	IOAPICMIO_DATA. Read-write. Reset: 0000_0000h. Data registers for IOAPIC MIO Indirect space.

IOAPICMMIO[0...3]x00000020 (IOAPIC::IRQ_PIN_ASSERTION_REGISTER)

Read-write. Reset: 0000_0000h.

Interrupt Request Register

`_iohub[1:0]_nbio0_aliasSMN; IOAPICMMIO[1:0]x00000020; IOAPICMMIO[1:0]=02[9:8]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICMMIO[3:2]x00000020; IOAPICMMIO[3:2]=02[B:A]0_0000h``_iohub0_nbio0_aliasHOST; IOAPICMMIO0x20; IOAPICMMIO0={IOHC::IOAPIC_BASE_ADDR_HI_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_HI] , IOHC::IOAPIC_BASE_ADDR_LO_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_LO] , 00h}``_iohub1_nbio0_aliasHOST; IOAPICMMIO1x20; IOAPICMMIO1={IOHC::IOAPIC_BASE_ADDR_HI_iohub1_nbio1_aliasSMN[IOAPIC_BASE_ADDR_HI] , IOHC::IOAPIC_BASE_ADDR_LO_iohub1_nbio0_aliasSMN[IOAPIC_BASE_ADDR_LO] , 00h}`

Bits	Description
31:8	Reserved.
7:0	Input_IRQ. Read-write. Reset: 00h. This register triggers an interrupt associated with the specific redirection entry table.

IOAPICMMIO[0...3]x00000040 (IOAPIC::EOI_REGISTER)

Write-only. Reset: 0000_0000h.

EOI Register

`_iohub[1:0]_nbio0_aliasSMN; IOAPICMMIO[1:0]x00000040; IOAPICMMIO[1:0]=02[9:8]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICMMIO[3:2]x00000040; IOAPICMMIO[3:2]=02[B:A]0_0000h``_iohub0_nbio0_aliasHOST; IOAPICMMIO0x40; IOAPICMMIO0={IOHC::IOAPIC_BASE_ADDR_HI_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_HI] , IOHC::IOAPIC_BASE_ADDR_LO_iohub0_nbio0_aliasSMN[IOAPIC_BASE_ADDR_LO] , 00h}``_iohub1_nbio0_aliasHOST; IOAPICMMIO1x40; IOAPICMMIO1={IOHC::IOAPIC_BASE_ADDR_HI_iohub1_nbio1_aliasSMN[IOAPIC_BASE_ADDR_HI] , IOHC::IOAPIC_BASE_ADDR_LO_iohub1_nbio0_aliasSMN[IOAPIC_BASE_ADDR_LO] , 00h}`

Bits	Description
31:8	Reserved.
7:0	Vector. Write-only. Reset: 00h. Description: This register clears the remote IRR bit in the redirection table entry for the corresponding interrupt vector. This provides an alternate mechanism other than the EOI special cycle to reach IOAPIC.

IOAPICMMIOINDEX[0...3]x00000000 (IOAPIC::IOAPIC_ID_REGISTER)

Read-write. Reset: 0000_0000h.

ID Register

`_iohub[1:0]_nbio0_aliasSMN; IOAPICMMIOINDEX[1:0]x00000000; IOAPICMMIOINDEX[1:0]=02[9:8]0_1000h``_iohub[1:0]_nbio1_aliasSMN; IOAPICMMIOINDEX[3:2]x00000000; IOAPICMMIOINDEX[3:2]=02[B:A]0_1000h`

Bits	Description
31:28	EXTEND_ID. Read-write. Reset: 0h. Extended device id, writable only if Ioapic_id_ext_en is set.
27:24	DEV_ID. Read-write. Reset: 0h. IOAPIC device ID.
23:0	Reserved.

IOAPICMMIOINDEX[0...3]x00000004 (IOAPIC::IOAPIC_VERSION_REGISTER)

Read-only. Reset: Fixed,001F_8021h.

Version Register

_iohub[1:0]_nbio0_aliasSMN; IOAPICMMIOINDEX[1:0]x00000004; IOAPICMMIOINDEX[1:0]=02[9:8]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOAPICMMIOINDEX[3:2]x00000004; IOAPICMMIOINDEX[3:2]=02[B:A]0_1000h

Bits	Description
31:24	Reserved.
23:16	Max_Redirection_Entries. Read-only. Reset: Fixed,1Fh. The maximum number of redirection entries minus one.
15	PRQ. Read-only. Reset: Fixed,1. IRQ pin assertion supported.
14:8	Reserved.
7:0	Version. Read-only. Reset: Fixed,21h. PCI 2.2 compliant.

IOAPICMMIOINDEX[0...3]x00000008 (IOAPIC::IOAPIC_ARBITRATION_REGISTER)

Read-write. Reset: 0000_0000h.

Arbitration Register

_iohub[1:0]_nbio0_aliasSMN; IOAPICMMIOINDEX[1:0]x00000008; IOAPICMMIOINDEX[1:0]=02[9:8]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOAPICMMIOINDEX[3:2]x00000008; IOAPICMMIOINDEX[3:2]=02[B:A]0_1000h

Bits	Description
31:28	Reserved.
27:24	Arbitration_ID. Read-write. Reset: 0h. Arbitration ID.
23:0	Reserved.

**IOAPICMMIOINDEX0x00000040...IOAPICMMIOINDEX3x00000138
(IOAPIC::REDIRECTION_TABLE_ENTRY_LOW)**

Reset: 0001_0000h.

Controls for the corresponding redirection table entry.

Bits	Description
31:24	Destination_id. Read-write. Reset: 00h. Bits 19-12 of the address of the interrupt message.
23:0	Reserved.

13.5 I/O Memory Management Unit (IOMMU)

The I/O Memory Management Unit (IOMMU) extends the AMD64 system architecture by adding support for address translation and system memory access protection on DMA transfers from peripheral devices.

13.5.1 Functional Description

13.5.1.1 Definitions

Table 233: Link Definitions

Term	Description
IOMMU	I/O Memory Management Unit
PDC	Page Directory Cache
PDE	Page Directory Entry
PTE	Page Table Entry

13.5.1.2 Programming Reference

13.5.1.2.1 IOMMU SMI Filtering

To ensure system management interrupts come from valid peripheral sources, the IOMMU supports an [SMI](#) filter (IOMMUMMIO::IOMMU_MMIO_EFR_0[SMIF_SUP] == 01b). SMI interrupts are filtered according to the values programmed in the SMI filter registers. The registers specify what sources are allowed to send SMI interrupts.

IOMMUMMIO::IOMMU_MMIO_EFR_0[SMIF_RC] indicates the number of SMI filter registers available.

The BIOS should set up the SMI filter registers and lock them. These settings take effect when system software enables the IOMMU and enables SMI filtering. BIOS should perform the following steps to set up SMI filtering:

1. Choose an SMI filter register from the available set described in IOMMUMMIO::IOMMU_MMIO_EFR_0[SMIF_RC]. Select one register for each SMI source.
2. Program selected SMI filter register to the Device ID of the peripheral issuing the SMI interrupts via IOMMUMMIO::SMI_FILTER_REGISTER_0_0[SmiDID_0], IOMMUMMIO::SMI_FILTER_REGISTER_1_0[SmiDID_1], IOMMUMMIO::SMI_FILTER_REGISTER_2_0[SmiDID_2], IOMMUMMIO::SMI_FILTER_REGISTER_3_0[SmiDID_3]. Program one register for each SMI source.
3. Program selected SMI filter register to be valid via IOMMUMMIO::SMI_FILTER_REGISTER_0_0[SmiDV_0], IOMMUMMIO::SMI_FILTER_REGISTER_1_0[SmiDV_1], IOMMUMMIO::SMI_FILTER_REGISTER_2_0[SmiDV_2], IOMMUMMIO::SMI_FILTER_REGISTER_3_0[SmiDV_3]. Program one register for each SMI source.
4. Program selected SMI filter register to be locked via IOMMUMMIO::SMI_FILTER_REGISTER_0_0[SmiFLock_0], IOMMUMMIO::SMI_FILTER_REGISTER_1_0[SmiFLock_1], IOMMUMMIO::SMI_FILTER_REGISTER_2_0[SmiFLock_2], IOMMUMMIO::SMI_FILTER_REGISTER_3_0[SmiFLock_3]. Program one register for each SMI source.

13.5.1.2.2 x2APIC Enablement

The IOMMU supports the extensions of interrupt processor addressability when the system is in x2APIC mode. The support of this capability is indicated by IOMMUMMIO::IOMMU_MMIO_EFR_0[XT_SUP]. To enable x2APIC:

1. Program IOMMUMMIO::IOMMU_MMIO_CNTRL_0[IOMMU_EN] to enable IOMMU.
2. Program IOMMUMMIO::IOMMU_MMIO_CNTRL_1[XT_EN] to 1.

13.5.2 Registers

13.5.2.1 IOMMUL1 Registers

IOMMUL1IOAGRPCIEx00000024...IOMMUL1PCIE7x00000024 (IOMMUL1::L1_SB_LOCATION)

Bits	Description
31	L1InterruptHalfDwDis. Read-write. Reset: 0. Disable interrupt DW check.
30:29	L1ForceHostRspPassPWHigh. Read-write. Reset: 0h. Forces the incoming host response to have PassPW=1 behavior. 0x00 = Disabled. 0x01 = Force incoming HostRdRsp PassPW = 1. 0x10 = Force incoming HostWrRsp PassPW = 1. 0x11 = Force both HostRdRsp and HostWrRsp PassPW = 1.
28	L1ErrEventDetectDis. Read-write. Reset: 0. Disable ErrEvent Detection in L1.
27:24	L1Entries. Read-only. Reset: 5h. Set by hardware - number of entries in each L1 cache , 2^L1entries.
23	Reserved.
22:20	L1Banks. Read-only. Reset: 1h. Set by hardware - number of caches in L1.
19:5	Reserved.
4	L1ForceOrderedAbort. Read-write. Reset: 0. Forces responses for aborted DMA requests to return in order with other DMA requests in L1.
3	CacheIW_only. Read-write. Reset: 1. Cache write only pages in L1.
2	CacheIR_only. Read-write. Reset: 1. Cache read only pages in L1.
1	Fragment_dis. Read-write. Reset: 0. Disable variable page size support in L1 cache - only 4K pages.
0	Reserved.

IOMMUL1IOAGRPCIEx00000034...IOMMUL1PCIE7x00000034 (IOMMUL1::L1_CNTRL_1)

Read-write. Reset: 0010_0500h.

_inst[IOAGR,PCIE[1:0]]_iohub0_nbio0_aliasSMN; IOMMUL1IOAGRPCIEx0,IOMMUL1PCIE[4,0]=[15300000,14B00000,14700000]h

_inst[IOAGR,PCIE[1:0]]_iohub1_nbio0_aliasSMN; IOMMUL1IOAGRPCIEx1,IOMMUL1PCIE[5,1]=[15400000,14C00000,14800000]h

_inst[IOAGR,PCIE[1:0]]_iohub0_nbio1_aliasSMN; IOMMUL1IOAGRPCIEx2,IOMMUL1PCIE[6,2]=[15500000,14D00000,14900000]h

_inst[IOAGR,PCIE[1:0]]_iohub1_nbio1_aliasSMN; IOMMUL1IOAGRPCIEx3,IOMMUL1PCIE[7,3]=[15600000,14E00000,14A00000]h

Bits	Description
31	Reserved.
30	L1StrictVCOOrder_En. Read-write. Reset: 0. Enables strict ordering of all requests within a VC (VC0/1/3/7)
29	UnTrans_2M_filterEn. Read-write. Reset: 0. Enable filtering of requests on a 2M boundry instead of 4K
28	Pretrans_noVA_filterEn. Read-write. Reset: 0. When set, VA is not used for filtering pretrans requests
27	L1_cache_sel_interleave. Read-write. Reset: 0. When set causes cache updates to toggle between multiple caches.
26	L1_cache_sel_reqid. Read-write. Reset: 0. When set allows the reqid to be used in hashing between multiple L1 caches.
25:23	Select_timeout_pulse. Read-write. Reset: 0h. 00b = ATS_tlbinv_pulse_width is used for Invalidation Timeout, else a fixed value is used.
22	L1CacheInvAllEn. Read-write. Reset: 0. Enables invalidation of entire cache when invalidation command is sent.
21	Reserved.
20	Snd_filter_dis. Read-write. Reset: 1. Disables filtering of requests to L2.
19:13	WQ_EntryDis. Read-write. Reset: 00h. These bits are appended to bottom of WQ_EntryDis1 Register. Value indicates how many credits should be limited by the L1 to the client. This value is subtracted from the number of WQ entries to determine the number of credits available to be released.
12	L1DTEDis. Read-write. Reset: 0. Disables L1 caching of DTE.
11	Reserved.
10	L1CacheParityEn. Read-write. Reset: 1. Enables forced miss of L1 cache due to failed parity check.
9	Reserved.
8	TLBRdPred_dis. Read-write. Reset: 1. Disable predictive TLP Rd Latency optimization.
7:5	Reserved.
4	QoSAlwaysPasses_dis. Read-write. Reset: 0. 0- Oldest QoS Request (VC5) always get priority over other ready requests in L1 ordering. 1 - Ready request on any VC get sent upstream in the oldest to youngest order
3	Reserved.
2	timeout_on_any_migr_state. Read-write. Reset: 0. Description: 0 - DMA requests in HVPM non stall state will not be aborted due to timeout. 1 - DMA requests in any non idle migration state may be aborted due to timeout.
1:0	Reserved.

IOMMUL1IOAGRPCIE0x00000038...IOMMUL1PCIE7x00000038 (IOMMUL1::L1_CNTRL_2)

Read-write.

_inst[IOAGR,PCIE[1:0]]_iohub0_nbio0_aliasSMN; IOMMUL1IOAGRPCIE0,IOMMUL1PCIE[4,0]x00000038;

IOMMUL1IOAGRPCIE3,IOMMUL1PCIE[7,3]=[15600000,14E00000,14A00000]h

Bits	Description
31:30	WQ_EntryDis1. Read-write. Reset: 0h. These bits are appended to top of WQ_EntryDis Register. Value indicates how many credits should be limited by the L1 to the client. This value is subtracted from the number of WQ entries to determine the number of credits available to be released.
29	L1SDPParityEn. Read-write. Reset: 1. Enables parity checking in L1 for ingress SDP requests. Forces all Datapath parity options (logging and data error signaling) to be disabled if this bit is set to 0.
28	L1ConsumedDataErrorSignalEn. Read-write. Reset: 1. Enables asserting Data Error on egress sdp request when parity check fails on IOMMU consumed data.
27	L1NonConsumedDataErrorSignalEn. Read-write. Reset: 0. Enables asserting Data Error on egress sdp request when parity check fails on IOMMU non-consumed data.
26:24	CPD_RESP_MODE. Read-write. Reset: 2h. Description: 000 = No response taken when IOMMU consumes poisoned data. 001 = ErrEvent issued when IOMMU consumes poisoned data. 010 = Target Abort issued when IOMMU consumes poisoned data. 011 = Master Abort issued when IOMMU consumes poisoned data.
23:9	Reserved.
8:7	L1_IOHC_RdRsp_ordering. Read-write. Control whether to order the RdRsp in the SION from IOHC. 00 - Ordering based on PassPW; 01 - Strict ordering on responses; 10 - Relaxed ordering on all responses
6:5	L1_IOHC_WrRsp_ordering. Read-write. Controls whether to order the WrRsp in the SION from IOHC. 00 - Ordering based on PassPW; 01 - Strict ordering on responses; 10 - Relaxed ordering on all responses
4	Reserved.
3	L1ATSDDataErrorSignalEn. Read-write. Reset: 1. Enables setting RdRspDataStatus to 1 when ats macro fails parity check. RdRspDataStatus=3 when this is disabled.
2	L1_abrt_ats_dis. Read-write. Reset: 0. Disable abort of ats requests when iommu is disabled.
1:0	Reserved.

Bits	Description
15:11	Reserved.
10	INTERRUPT_DIS. Read-write. Reset: 0. 0=Disable. 1=Enable. Description: Interrupt Disable. 1=This function is not allowed to generate legacy INTx interrupts. 0=This function is allowed to generate legacy INTx interrupts.
9	Reserved.
8	SERR_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Description: System Error Enable. This function does not set the signaled system error status bit.
7	Reserved.
6	PARITY_ERROR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Description: Parity Error Enable. 1=This function is allowed to set the PARITY_ERROR_DETECTED status bit. 0=This function is not allowed to set the PARITY_ERROR_DETECTED status bit.
5:3	Reserved.
2	BUS_MASTER_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Description: Bus Master Enable 1=This function is allowed to generate DMA requests. 0=This function is not allowed to generate DMA requests.
1	MEM_ACCESS_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Description: Memory Access Enable This register controls no hardware. This function does not declare any standard memory BARs.
0	IO_ACCESS_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Description: I/O Access Enable This register controls no hardware. This function does not declare any standard I/O BARs.

Bits	Description
15	PARITY_ERROR_DETECTED. Write-1-to-clear. Reset: Cold,0. Description: Parity Error Detected. This bit is set by hardware whenever this function receives a read response with the data error attribute set.
14	SIGNALED_SYSTEM_ERROR. Read-only. Reset: Fixed,0. Description: Signaled System Error This bit is always set to 0 because this function does not generate signaled system error status.
13	RECEIVED_MASTER_ABORT. Write-1-to-clear. Reset: Cold,0. 0=Inactive. 1=Active. Description: Received Target Abort. This bit is set by hardware whenever this function receives a read response with the master abort status.
12	RECEIVED_TARGET_ABORT. Write-1-to-clear. Reset: Cold,0. 0=Inactive. 1=Active. Description: Received Target Abort. This bit is set by hardware whenever this function receives a read response with the target abort status.
11	SIGNAL_TARGET_ABORT. Read-only. Reset: Fixed,0. 0=No Abort. 1=Target Abort asserted. Description: Signal Target Abort This bit is always set to 0 because this function does not terminate host requests with target abort.
10:9	Reserved.
8	MASTER_DATA_ERROR. Write-1-to-clear. Reset: Cold,0. 0=Disable. 1=Enable. Description: Master Data Error This bit is set by hardware whenever PARITY_ERROR_EN is set and this function receives a read response with the data error attribute set.
7:5	Reserved.
4	CAP_LIST. Read-only. Reset: Fixed,1. 0=Disable. 1=Enable. Description: Capabilities List This bit is set to indicate that this function's configuration space supports a capabilities list.
3	INT_Status. Read-only. Reset: 0. 0=Disable. 1=Enable. Description: Interrupt Status 1=This function has an outstanding interrupt 0=This function does not have any outstanding interrupts.
2:0	Reserved.

BXXD00F2x008 (IOMMUL2::IOMMU_REVISION_ID)

Read-only. Reset: 01h.

 _iohub1_nbio1_aliasHOST; BXXD00F2x03C; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio1_aliasSMN[NB_BUS_NUM]
 _iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x0000003C; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h
 _iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x0000003C; IOMMUL2BCFG[3:2]=14[2:1]0_0000h

Bits	Description
7:0	INTERRUPT_LINE . Read-write. Reset: 00h. This register is read/write for software compatibility. It controls no hardware.

BXXD00F2x03D (IOMMUL2::IOMMU_INTERRUPT_PIN)

Read-only. Reset: 01h.

_iohub0_nbio0_aliasHOST; BXXD00F2x03D; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]
 _iohub0_nbio1_aliasHOST; BXXD00F2x03D; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio1_aliasSMN[NB_BUS_NUM]
 _iohub1_nbio0_aliasHOST; BXXD00F2x03D; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio0_aliasSMN[NB_BUS_NUM]
 _iohub1_nbio1_aliasHOST; BXXD00F2x03D; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio1_aliasSMN[NB_BUS_NUM]
 _iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x0000003D; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h
 _iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x0000003D; IOMMUL2BCFG[3:2]=14[2:1]0_0000h

Bits	Description
7:0	INTERRUPT_PIN . Read-only. Reset: 01h. Description: This field indicates the INTx line used to generate legacy interrupts. 1 - INTA 2 - INTB 3 - INTC 4 - INTD All other encodings are not supported.

BXXD00F2x040 (IOMMUL2::IOMMU_CAP_HEADER)

Read-only.

`_iohub0_nbio0_aliasHOST; BXXD00F2x040; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]``_iohub0_nbio1_aliasHOST; BXXD00F2x040; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio1_aliasSMN[NB_BUS_NUM]``_iohub1_nbio0_aliasHOST; BXXD00F2x040; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio0_aliasSMN[NB_BUS_NUM]``_iohub1_nbio1_aliasHOST; BXXD00F2x040; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio1_aliasSMN[NB_BUS_NUM]``_iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x00000040; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x00000040; IOMMUL2BCFG[3:2]=14[2:1]0_0000h`

Bits	Description
31:29	Reserved.
28	IOMMU_CAP_EXT. Read-only. Reset: 1. 1=Indicates support for IOMMU Miscellaneous Information Register 1 [Capability Offset 14h]. 0=Capability Offset14h not supported.
27	IOMMU_EFR_SUP. Read-only. Reset: 1. Description: 1=Indicates IOMMU Extended Feature Register [MMIO Offset 0030h] is supported. 0=[MMIO Offset 0030h] is reserved.
26	IOMMU_NP_CACHE. Read-only. Reset: Fixed,0. Description: 1=Indicates that the IOMMU caches page table entries that are marked as not present. When this bit is set, software must issue an invalidate after any change to a PDE or PTE . 0=Indicates that the IOMMU caches only page table entries that are marked as present. When NpCache is clear, software must issue an invalidate after any change to a PDE or PTE marked present before the change. Implementation note: For hardware implementations of the IOMMU, this bit must be 0b.
25	IOMMU_HT_TUNNEL_SUP. Read-only. Reset: Fixed,0. Hypertransport tunnel translation support. This register is always set to 0 to indicate that the device does not contain a hypertransport tunnel supporting address translation.
24	IOMMU_IO_TLBSUP. Read-only. Reset: 1. Indicates support for remote IOTLBs.
23:19	IOMMU_CAP_REV. Read-only. Reset: Fixed,01h. Specifies the IOMMU specification revision.
18:16	IOMMU_CAP_TYPE. Read-only. Reset: Fixed,3h. Specifies the layout of the Capability Block as an IOMMU capability block.
15:8	IOMMU_CAP_PTR. Read-only. Reset: Fixed,64h. Indicates the location of the next capability block if one is present.
7:0	IOMMU_CAP_ID. Read-only. Reset: Fixed,0Fh. Indicates a Secure Device capability block.

BXXD00F2x044 (IOMMUL2::IOMMU_CAP_BASE_LO)

Read-write. Reset: 0000_0000h.

`_iohub0_nbio0_aliasHOST; BXXD00F2x044; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]``_iohub0_nbio1_aliasHOST; BXXD00F2x044; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio1_aliasSMN[NB_BUS_NUM]``_iohub1_nbio0_aliasHOST; BXXD00F2x044; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio0_aliasSMN[NB_BUS_NUM]``_iohub1_nbio1_aliasHOST; BXXD00F2x044; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio1_aliasSMN[NB_BUS_NUM]``_iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x00000044; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x00000044; IOMMUL2BCFG[3:2]=14[2:1]0_0000h`

Bits	Description
31:19	IOMMU_BASE_ADDR_LO. Read-write. Reset: 0000h. Specifies address bits 31:19 of the 512K-byte-aligned base address of the IOMMU memory-mapped control registers.
18:1	Reserved.
0	IOMMU_ENABLE. Read-write. Reset: 0. 1=IOMMU accepts memory accesses to the address specified in the Base Address Register. When Enable is written with a 1, all IOMMU RW capability registers in PCI configuration space are locked until the next system reset.

BXXD00F2x048 (IOMMUL2::IOMMU_CAP_BASE_HI)

Read-write. Reset: 0000_0000h.

`_iohub0_nbio0_aliasHOST; BXXD00F2x048; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]``_iohub0_nbio1_aliasHOST; BXXD00F2x048; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio1_aliasSMN[NB_BUS_NUM]``_iohub1_nbio0_aliasHOST; BXXD00F2x048; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio0_aliasSMN[NB_BUS_NUM]``_iohub1_nbio1_aliasHOST; BXXD00F2x048; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio1_aliasSMN[NB_BUS_NUM]``_iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x00000048; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x00000048; IOMMUL2BCFG[3:2]=14[2:1]0_0000h`**Bits Description**

31:0	IOMMU_BASE_ADDR_HI. Read-write. Reset: 0000_0000h. Specifies address bits 63:32 of the 512K-byte-aligned base address of the IOMMU memory-mapped control registers.
------	--

BXXD00F2x04C (IOMMUL2::IOMMU_CAP_RANGE)

Read-only.

`_iohub0_nbio0_aliasHOST; BXXD00F2x04C; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]``_iohub0_nbio1_aliasHOST; BXXD00F2x04C; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio1_aliasSMN[NB_BUS_NUM]``_iohub1_nbio0_aliasHOST; BXXD00F2x04C; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio0_aliasSMN[NB_BUS_NUM]``_iohub1_nbio1_aliasHOST; BXXD00F2x04C; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio1_aliasSMN[NB_BUS_NUM]``_iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x0000004C; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h``_iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x0000004C; IOMMUL2BCFG[3:2]=14[2:1]0_0000h`**Bits Description**

31:24	IOMMU_LAST_DEVICE. Read-only. Reset: 00h. Indicates device and function number of the last integrated device associated with the IOMMU.
-------	--

23:16	IOMMU_FIRST_DEVICE. Read-only. Reset: 00h. Indicates device and function number of the first integrated device associated with the IOMMU.
-------	--

15:8	IOMMU_BUS_NUMBER. Read-only. Reset: 00h. Indicates the bus number that IOMMU_FIRST_DEVICE and IOMMU_LAST_DEVICE reside on.
------	---

7	IOMMU_RNG_VALID. Read-only. Reset: 0.
---	--

Description: 1=The IOMMU_BUS_NUMBER, IOMMU_FIRST_DEVICE and IOMMU_LAST_DEVICE fields are valid. Although the register contents are valid, software is encouraged to use I/O topology information.
0=Software must use I/O topology information.

6:5	Reserved.
-----	-----------

4:0	IOMMU_UNIT_ID. Read-only. Reset: Fixed, 00h. This field returns the HyperTransport™ UnitID used by the IOMMU.
-----	--

Bits	Description
31:27	IOMMU_MSI_NUM_PPR. Read-only. Reset: 00h. This field must indicate which MSI vector is used for the interrupt message generated by the IOMMU for the peripheral page service request log when [MMIO Offset 0030h[PPR_SUP]] = 1. IOMMU_MSI_NUM_PPR must be 0 when PPR_SUP = 0. For MSI there can be only one IOMMU so this field must be 0. This interrupt is not remapped by the IOMMU.
26:23	Reserved.
22	IOMMU_HT_ATS_RESV. Read-write. Reset: 0. Description: 1=The HyperTransport? Address Translation address range for ATS responses is reserved and cannot be translated by the IOMMU. 0=The Address Translation address range can be translated by the IOMMU.
21:15	IOMMU_VA_SIZE. Read-only. Reset: Fixed,40h. Description: This field must indicate the size of the maximum virtual address processed by the IOMMU. The value is the (unsigned) binary log of the maximum address size. Allowed values are 32, 40, 48, and 64; all other values are reserved. 010_0000b = 32 bits 010_1000b = 40 bits 011_0000b = 48 bits
14:8	IOMMU_PA_SIZE. Read-only. Reset: 34h. Description: This field must indicate the size of the maximum physical address generated by the IOMMU. The value is the (unsigned) binary log of the maximum address size. Allowed values are 40, 48 and 52; all other values are reserved. 010_1000b = 40 bits 011_0000b = 48 bits 011_0100b = 52 bits
7:5	IOMMU_GVA_SIZE. Read-only. Reset: 3h. This field indicates the width of the maximum guest virtual address processed by iommu. 010=48 Bits, 011=57 Bits.
4:0	IOMMU_MSI_NUM. Read-only. Reset: 00h. Indicates the MSI vector used for interrupt messages generated by the IOMMU.

BXXD00F2x054 (IOMMUL2::IOMMU_CAP_MISC_1)

Reset: 0000_0000h.

_iohub0_nbio0_aliasHOST; BXXD00F2x054; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]

Bits	Description
31:10	Reserved.
9	GST_PAGE_TABLE_FMT_SEL. Read-write. Reset: 0. Indicates the page table format used by IOMMU. 0= IOMMU uses existing AMD64 long mode format. 1= IOMMU uses unified guest page table format.
8	STU_SIZE_SEL. Read-write. Reset: 0. Indicates the smallest translation unit supported by IOMMU. 0 = 4KB (expected to be set only during bring-up mode). 1 = 16KB (4 contiguous 4KB PTEs, expected to be production mode). Applies to both guest and host translations
7:5	Reserved.
4:0	IOMMU_MSI_NUM_GA. Read-only. Reset: 00h. MSI message number. Message number for MSI or MSI-X interrupt associated with the guest vAPIC virtual interrupt request log.

BXXD00F2x064 (IOMMUL2::IOMMU_MSI_CAP)

Bits	Description
31:24	Reserved.
23	MSI_64_EN. Read-only. Reset: Fixed,1. Set to indicate that a 64-bit MSI address is supported.
22:20	MSI_MULT_MESS_EN. Read-write. Reset: Cold,0h. Sets the number of MSI messages assigned to this function.
19:17	MSI_MULT_MESS_CAP. Read-only. Reset: 2h. Indicates the number of MSI messages requested by this function.
16	MSI_EN. Read-write. Reset: Cold,0. Enables MSI for this function and causes legacy interrupts to be disabled.
15:8	MSI_CAP_PTR. Read-only. Reset: Fixed,74h. Pointer to the next configuration space capability.
7:0	MSI_CAP_ID. Read-only. Reset: Fixed,05h. Indicates that this is the MSI capability.

BXXD00F2x068 (IOMMUL2::IOMMU_MSI_ADDR_LO)

Read-write. Reset: Cold,0000_0000h.

_iohub0_nbio0_aliasHOST; BXXD00F2x068; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]

Bits	Description
31:27	MSI_MAP_CAP_TYPE. Read-only. Reset: Fixed,15h. Indicates the MSI Mapping Capability.
26:18	Reserved.
17	MSI_MAP_FIXD. Read-only. Reset: Fixed,1. Always set to 1 to indicate that this device only maps MSI interrupts with address 0xFEE _x _xxxx onto Hypertransport interrupts and that the mapping range is not programmable.
16	MSI_MAP_EN. Read-only. Reset: Fixed,1. Always set to 1 to indicate that the MSI Mapping Capability is always enabled.
15:8	MSI_MAP_CAP_PTR. Read-only. Reset: Fixed,C8h. Points to the next capability list item.
7:0	MSI_MAP_CAP_ID. Read-only. Reset: Fixed,08h. Indicates a Hypertransport capability list item.

BXXD00F2x078 (IOMMUL2::IOMMU_ADAPTER_ID_W)

Read-write. Reset: Cold,149E_1022h.

_iohub0_nbio0_aliasHOST; BXXD00F2x078; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]

Bits	Description
31:24	Reserved.
23:17	IOMMU_PA_SIZE_W. Read-write. Reset: 34h. Description: This field sets the size of the maximum physical address generated by the IOMMU. Allowed values are 40, 48 and 52; all other values are reserved. 010_1000b = 40 bits 011_0000b = 48 bits 011_0100b = 52 bits
16:14	IOMMU_GVA_SIZE_W. Read-write. Reset: 3h. This field sets the width of the maximum guest virtual address processed by IOMMU. 010=48 Bits, 011=57 Bits.
13	IOMMU_CAP_EXT_W. Read-write. Reset: 1. 1=Indicates support for IOMMU Miscellaneous Information Register 1 [Capability Offset 14h]. 0=Capability Offset14h not supported.
12:10	MSI_MULT_MESS_CAP_W. Read-write. Reset: Cold,2h. Sets the number of MSI messages requested by this function.
9	EFR_SUP_W. Read-write. Reset: 1. Sets the value of EFR_SUP in the IOMMU capability, program the L1 copy of this register in IOMMUL1::L1_FEATURE_SUP_CNTRL[L1_EFR_SUP].
8	IO_TLBSUP_W. Read-write. Reset: 1. Sets the value of IO_TLBSUP in the IOMMU capability.
7:4	MINOR_REV_ID_W. Read-write. Reset: 1h. Sets the minor revision ID register in the configuration header.
3	Reserved.
2:0	INTERRUPT_PIN_W. Read-write. Reset: 1h. Description: Sets the INTERRUPT_PIN register in the configuration header. 0 = No legacy interrupts supported. 1 = INTA 2 = INTB 3 = INTC 4 = INTD

BXXD00F2x080 (IOMMUL2::IOMMU_MMIO_CONTROL0_W)

Read-write. Reset: 6621_BAFeh.

_iohub0_nbio0_aliasHOST; BXXD00F2x080; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio0_aliasSMN[NB_BUS_NUM]_iohub0_nbio1_aliasHOST; BXXD00F2x080; BXX=IOHC::NB_BUS_NUM_CNTL_iohub0_nbio1_aliasSMN[NB_BUS_NUM]_iohub1_nbio0_aliasHOST; BXXD00F2x080; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio0_aliasSMN[NB_BUS_NUM]_iohub1_nbio1_aliasHOST; BXXD00F2x080; BXX=IOHC::NB_BUS_NUM_CNTL_iohub1_nbio1_aliasSMN[NB_BUS_NUM]_iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x00000080; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x00000080; IOMMUL2BCFG[3:2]=14[2:1]0_0000h

Bits	Description
31:30	GLX_SUP_W. Read-write. Reset: 1h. Description: 00=single-level guest CR3 base table address translation is support. When GLXSup=00b, the value of GLX in the DTE is ignored and the IOMMU performs only single-level Guest CR3 lookups. 01=Two-level GCR3 base address table is supported in hardware. 10= Three-level GCR3 base address table is supported in hardware for 20-bit PASID values in the future. 11= Reserved.single-level GCR3 base table address translation is supported. When GLX_SUP=0, GLX in the DTE is ignored. The value of GLXSup is not meaningful when GTSup=0.
29:28	EVENTF_W. Read-write. Reset: 2h. Description: 0x0=Event log dual buffer autoswap not supported. 0x1=Event log dual buffer supported without autoswap. 0x2=Event log dual buffer autoswap supported. All other encodings reserved.
27	Reserved.
26	CXLIO_SUP_W. Read-write. Reset: 1. Description: 1=Hardware supports Memory Type indication on ATS completion for CXL™ Device. 0=Hardware does not support Memory Type indication on ATS completion for CXL™ Device.
25:24	PPRF_W. Read-write. Reset: 2h. Description: 0x0=PPR log dual buffer not supported. 0x1=PPR log dual buffer supported without autoswap. 0x2=PPR log dual buffer autoswap supported. All other encodings reserved.
23:21	GAM_SUP_W. Read-write. Reset: 1h. Sets the GAM_SUP value in IOMMU Extended feature register.
20:18	SNPAVICSup_W. Read-write. Reset: 0h. Description: 0x0=Hardware does not support AVIC in conjunction with SNP. 0x1 = Hardware supports AVIC and SNP enabled in conjunction.
17	GstBufferTRPModeSup_W. Read-write. Reset: 0. Description: 0=IOMMU will calculate base address of buffer algorithmically in the IOMMU private space. The IOMMU private PA will then be translated to System PA using IOMMU v1 page tables. . 1=GuestX VF Control MMIO Offsets 18h-38h will contain Guest Physical Address of the buffer base address. The GPA will then be translated to System PA using Guest host page tables. 1=IOMMU behavior defined by MMIO control GstBufferTRPMode.
16	GCR3TRPModeSup_W. Read-write. Reset: 1. Sets the GCR3TRPModeSup value in IOMMU Extended feature register.
15	PageMigration_SUP_W. Read-write. Reset: 1. Sets the PageMigration_SUP value in IOMMU Extended feature register.
14:13	GATS_W. Read-write. Reset: 1h. Sets the GATS value in IOMMU Extended feature register.
12	US_SUP_W. Read-write. Reset: 1. Sets the US_SUP value in IOMMU Extended featurer registers.
11:10	HATS_W. Read-write. Reset: 2h. Sets the HATS value in IOMMU Extended feature register.
9	PC_SUP_W. Read-write. Reset: 1. Sets the PC_SUP value in IOMMU Extended feature register.
8	HE_SUP_W. Read-write. Reset: 0. Sets the HE_SUP value in IOMMU Extended feature register.
7	GA_SUP_W. Read-write. Reset: 1. Sets the GA_SUP value in IOMMU Extended feature register.
6	IA_SUP_W. Read-write. Reset: 1. Sets the IA_SUP value in IOMMU Extended feature register.

5	sATS_SUP_W . Read-write. Reset: 1. 1 = Hardware supports sATS.
4	GT_SUP_W . Read-write. Reset: 1. Sets the GT_SUP value in IOMMU Extended feature register, program the L1 copy of this register in IOMMUL1::L1_FEATURE_SUP_CNTRL[L1_GT_SUP_W].
3	NX_SUP_W . Read-write. Reset: 1. Sets the NX_SUP value in IOMMU Extended feature register.
2	XT_SUP_W . Read-write. Reset: 1. Sets the XT_SUP value in IOMMU Extended feature register.
1	PPR_SUP_W . Read-write. Reset: 1. Sets the PPR_SUP value in IOMMU Extended feature register, program the L1 copy of this register in IOMMUL1::L1_FEATURE_SUP_CNTRL[L1_PPR_SUP].
0	PREF_SUP_W . Read-write. Reset: 0. Sets the PREF_SUP value in IOMMU Extended feature register.

BXXD00F2x084 (IOMMUL2::IOMMU_MMIO_CONTROL1_W)

Read-write. Reset: B97F_C70Fh.

Bits	Description
31	SNP_SUP_W. Read-write. Reset: 1. 1 = Hardware supports SNP.
30	ForcePhyDestSup_W. Read-write. Reset: 0. 1 = HW supports forcing physical destination mode for remapped interrupts.
29	GAPPIDis_SUP_W. Read-write. Reset: 1. 1 = HW supports masking Guest APIC Physical Processor Interrupt based on IRTE[GAPPIDis] when Interrupt Virtualization is enabled.
28	GAPPI_SUP_W. Read-write. Reset: 1. 1 = HW support Guest APIC Physical Processor Interrupt when Interrupt Virtualization is enabled
27	V2_HA_DIS_SUP_W. Read-write. Reset: 1. 1 = Hardware supports Disabling v2 Access bit updates by HW.
26:23	VMTABLESIZE_W. Read-write. Reset: 2h. Description: indicate the size of the VMTable supported. 00h 256 entries 04h 4K entries 08h 64K entries 01h 512 entries 05h 8K entries 09h 128K entries 02h 1K entries 06h 16K entries 0Ah 256K entries 03h 2K entries 07h 32K entries 0Bh 512K entries 0Ch-0Fh: Reserved
22	SVEIO_SUP_W. Read-write. Reset: 1. 1 = SVEIO supported by the HW.
21	VIOMMU_SUP_W. Read-write. Reset: 1. 1 = HW supports virtualized IOMMU.
20	HD_SUP_W. Read-write. Reset: 1. 1 = Hardware supports Dirty bit update support for v1 Page tables.
19	InvIotlbTypeSup_W. Read-write. Reset: 1. 1 = Hardware supports invalidate IOTLB type.
18	V2_HD_DIS_SUP_W. Read-write. Reset: 1. 1 = Hardware supports Disabling v2 Dirty bit updates by hardware.
17	ATTRFW_SUP_W. Read-write. Reset: 1. 1 = Hardware supports forward page table memory attribute to ATC client.
16	EPH_SUP_W. Read-write. Reset: 1. 1 = Hardware supports Enhanced PPR Handling.
15	HA_SUP_W. Read-write. Reset: 1. 1 = Hardware supports Access bit update support for v1 Page tables.
14	GIO_SUP_W. Read-write. Reset: 1. 1 = Hardware supports nested I/O protection.
13	SNOOP_ATTRS_SUP_W. Read-write. Reset: 0. 1 = Hardware supports returning memory attributes of the guest page to ATS requester along with ATS completion.
12:11	MARCnum_SUP_W. Read-write. Reset: 0h. Writes number of MARC apertures and thus the number of MARC register 3-tuples supported. 00b = MARC feature not supported, 01b = 4 MARC registers 3-tuples supported, 10b = 8 MARC register 4-tuples are supported, 11b = Reserved.
10	BLOCK_STOPMARK_SUP_W. Read-write. Reset: 1. Description: 0=No blocking Stop Mark Messages supported. 1=Block Stop Mark Messages supported.
9	PPR_AUTORESP_SUP_W. Read-write. Reset: 1. 0x1 - Hardware supports ppr auto response generation on log about to be full or generate autoresp on reaching threshold if enabled with IOMMUMMIO::IOMMU_MMIO_PPR_OVERFLOW_EARLY_0[PPR_Overflow_early_en] or IOMMUMMIO::IOMMU_MMIO_PPR_B_OVERFLOW_EARLY_0[PPR_B_Overflow_early_en].
8	PPR_OVERFLOW_EARLY_SUP_W. Read-write. Reset: 1. 0x1 - Hardware supports PPR_OVERFLOW_EARLY notification on threshold support.
7:6	DTE_seg_W. Read-write. Reset: 0h.

	Description: 0x0 - Hardware supports no DTE segmentation. 0x1 - Hardware supports 2-way DTE segmentation. 0x2 - Hardware supports 4-way DTE segmentation. 0x3 - Hardware supports 8-way DTE segmentation. Program the L1 copy of this register in IOMMUL1::L1_FEATURE_SUP_CNTRL[L1_DTE_seg_W].
5:4	Reserved.
3:0	PAS_MAX_W. Read-write. Reset: Fh. Sets the PAS_MAX value in IOMMU Extended feature register.

BXXD00F2x088 (IOMMUL2::IOMMU_RANGE_W)

Read-write. Reset: 0000_0000h.

31:1 Reserved.

0 **GST_PREFETCH_ACCESS_PRESET**. Read-write. Reset: 0. Indicates if Access bit is required to be preset for prefetching guest PTEs. 0=guest PTEs are not required to have A bit preset in order for HW to prefetch them. 1=guest PTEs are required to have A preset for HW to prefetch them. This register only applies to prefetched guest PTEs (not to original [PTE](#))

BXXD00F2x300 (IOMMUL2::IOMMU_VIOMMU_PM_STALL_RETRY_CNTRL)

Read-write. Reset: 0000_0100h.

Register used to control the IOMMU retry on stalled VIOMMU buffer access.

_iohub0_nbio0_aliasHOST; BXXD00F2x300; BXX=IOHC::NB_BUS_NUM_CNTL_ _iohub0_nbio0_aliasSMN[NB_BUS_NUM]_iohub0_nbio1_aliasHOST; BXXD00F2x300; BXX=IOHC::NB_BUS_NUM_CNTL_ _iohub0_nbio1_aliasSMN[NB_BUS_NUM]_iohub1_nbio0_aliasHOST; BXXD00F2x300; BXX=IOHC::NB_BUS_NUM_CNTL_ _iohub1_nbio0_aliasSMN[NB_BUS_NUM]_iohub1_nbio1_aliasHOST; BXXD00F2x300; BXX=IOHC::NB_BUS_NUM_CNTL_ _iohub1_nbio1_aliasSMN[NB_BUS_NUM]_iohub[1:0]_nbio0_aliasSMN; IOMMUL2BCFG[1:0]x00000300; IOMMUL2BCFG[1:0]=1[40:3F]0_0000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2BCFG[3:2]x00000300; IOMMUL2BCFG[3:2]=14[2:1]0_0000h**Bits Description**

31:18 Reserved.

17:8 **tw_resend_limit**. Read-write. Reset: 001h. Total retry limit time after which stall migrating requesting will be aborted. The range is between 1s and 1ms with granularity of 1ms. 0= abort request after 1ms, 2=abort request after 2ms and so on

7:0 **tw_resend_freq**. Read-write. Reset: 00h. Period before request that is stalled due to page migration will re-attempt a translation. The range is between 500ns to 10us with granularity of 50ns. 0=retry right away. 1= retry after 500ns, 1=retry after 550ns and so on

IOMMUL2ACFG[0...3]x00000030 (IOMMUL2::L2_CONTROL_0)

Read-write. Reset: 0008_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000030; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000030; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:24	IFifoClientPriority. Read-write. Reset: 00h. Each bit of this register controls whether the corresponding L1 client is arbitrated as high priority or not. Not all implementations use all of the priority bits due to a lower number of clients versus the register width.
23:20	IFifoBurstLength. Read-write. Reset: 0h. Sets the burst length when arbitrating between clients coming into the L2.
19	AllowL1CacheLargePagemode0. Read-write. Reset: 1. 1=Requests with DTE.MODE=0 will be stored in the L1 TLB as large pages. 0=Requests with DTE.MODE=0 will be stored in the L1 TLB as 4k pages. Note: This register must be programmed to the same value as its copy in L1_MISC_CNTRL_2 located in iommu_l1 and in L2_MISC_CNTRL_3 in iommu_l2indx.
18:12	Reserved.
11	SIDEPTEOnAddrTransExcl. Read-write. Reset: 0. Description: 0=Caches return DTE to L1 on an address translation exclusion range access 1=Caches return PTE to L1 on an address translation exclusion range access.
10	SIDEPTEOnUntransExcl. Read-write. Reset: 0. Description: 0=Caches return DTE to L1 on an untranslated exclusion range access 1=Caches return PTE to L1 on an untranslated exclusion range access.
9:4	Reserved.
3	DTCHitVZeroOrIVZero. Read-write. Reset: 0. Description: 0=A DTE is refetched if a DTE with V=0 for a memory request or IV=1 for an interrupt request is hit in the DTC. 1=A DTE is not refetched if a DTE with V=0 for a memory request or IV=1 for an interrupt request is hit in the DTC. This DTE is used.
2	AllowL1CacheATSRsp. Read-write. Reset: 0. Description: 0=L2 does not allow L1 to cache responses to ATS address translation requests. 1=L2 allows L1 to cache responses to ATS address translation requests.
1	AllowL1CacheVZero. Read-write. Reset: 0. Description: 1=L2 does not allow L1 to cache DTEs where V=0. 0=L2 allows L1 to cache DTEs where V=0 L1 stores IR and IW as if they are both set to 1.
0	Reserved.

IOMMUL2ACFG[0...3]x00000034 (IOMMUL2::L2_CONTROL_1)

Read-write. Reset: 0001_0808h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000034; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000034; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:24	PerfThreshold. Read-write. Reset: 00h. Fifo threshold level used to calculate certain performance counter values.
23:17	Reserved.
16	SeqInvBurstLimitEn. Read-write. Reset: 1. Enable stalling L2 requests to allow invalidation cycles to make forward progress based upon SeqInvBurstLimitInv and SeqInvBurstLimitL2Req.
15:8	SeqInvBurstLimitL2Req. Read-write. Reset: 08h. Sets the number of consecutive iommu L2 requests to perform when doing sequential invalidation. Regular L2 and invalidation requests alternate access to the main L2 caches based upon SeqInvBurstLimitInv and SeqInvBurstLimitL2Req.
7:0	SeqInvBurstLimitInv. Read-write. Reset: 08h. Sets the number of consecutive invalidation requests to perform when doing sequential invalidation. Regular L2 and invalidation requests alternate access to the main L2 caches based upon SeqInvBurstLimitInv and SeqInvBurstLimitL2Req.

IOMMUL2ACFG[0...3]x00000040 (IOMMUL2::L2_DTC_CONTROL)

Reset: B004_8210h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000040; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000040; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:28	DTCEntries . Read-only. Reset: Bh. The number of entries in the DTC is indicated as $2^{\text{DTCEntries}}$.
27:24	Reserved.
23:16	DTCWays . Read-only. Reset: 04h. Indicates the number of ways in the DTC.
15	DTCParitySupport . Read-only. Reset: 1. Description: 0=The DTC does not support parity protection. 1=The DTC supports parity protection.
14	Reserved.
13	DTCBypass . Read-write. Reset: 0. When set, all requests bypass the DTC.
12:11	Reserved.
10	DTCSoftInvalidate . Read-write. Reset: 0. Software may write this register to 1 to invalidate all entries in the DTC.
9:8	DTCInvalidationSel . Read-write. Reset: 2h. Description: Selects the DTC invalidation algorithm. 00=Invalidate the entire DTC 01=Fast imprecise invalidation 10=Sequential precise invalidation 11=Partial sequential precise invalidation
7:5	Reserved.
4	DTCParityEn . Read-write. Reset: 1. Enable parity protection of the DTC.
3	DTCLRUpdatePri . Read-write. Reset: 0. Description: 0=Reads update replacement state bits when there is a simultaneous read and write to the same DTC index. 1=Writes update replacement state bits when there is a simultaneous read and write to the same DTC index.
2:0	Reserved.

IOMMUL2ACFG[0...3]x00000044 (IOMMUL2::L2_DTC_HASH_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000044; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000044; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:16	DTCAddressMask . Read-write. Reset: 0000h. This register is a bit-wise AND mask that selects which bits from the untranslated interrupt {MT[2:0], Vector} are used to index into the DTC.
15:0	Reserved.

IOMMUL2ACFG[0...3]x00000048 (IOMMUL2::L2_DTC_WAY_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000048; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000048; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:16	DTCWayAccessDisable . Read-write. Reset: 0000h. Used with DTCWayDisable to disable a way of set associativity.
15:0	DTCWayDisable . Read-write. Reset: 0000h. Each bit in this register disables a way in the DTC when set to 1. An implementation may have less than 32 ways. The entire cache may be disabled by setting the DTCWays lower bits of this register.

IOMMUL2ACFG[0...3]x00000050 (IOMMUL2::L2_ITC_CONTROL)

Reset: B004_8210h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000050; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000050; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:28	ITCEntries . Read-only. Reset: Bh. The number of entries in the ITC is indicated as $2^{\wedge}ITCEntries$.
27:24	Reserved.
23:16	ITCWays . Read-only. Reset: 04h. Indicates the number of ways in the ITC.
15	ITCParitySupport . Read-only. Reset: 1. Description: 0=The ITC does not support parity protection. 1=The ITC supports parity protection.
14	Reserved.
13	ITCBypass . Read-write. Reset: 0. When set, all requests bypass the ITC.
12:11	Reserved.
10	ITCSoftInvalidate . Read-write. Reset: 0. Software may write this register to 1 to invalidate all entries in the ITC.
9:8	ITCInvalidationSel . Read-write. Reset: 2h. Description: Selects the ITC invalidation algorithm. 00=Invalidate the entire ITC 01=Fast imprecise invalidation 10=Sequential precise invalidation 11=Partial sequential precise invalidation
7:5	Reserved.
4	ITCParityEn . Read-write. Reset: 1. Enable parity protection of the ITC.
3	ITCLRUpdatePri . Read-write. Reset: 0. Description: 0=Reads update replacement state bits when there is a simultaneous read and write to the same ITC index. 1=Writes update replacement state bits when there is a simultaneous read and write to the same ITC index.
2:0	Reserved.

IOMMUL2ACFG[0...3]x00000054 (IOMMUL2::L2_ITC_HASH_CONTROL)

Read-write. Reset: 0000_0000h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000054; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000054; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:16	ITCAddressMask . Read-write. Reset: 0000h. This register is a bit-wise AND mask that selects which bits from the untranslated interrupt {MT[2:0], Vector} are used to index into the ITC.
15:0	Reserved.

IOMMUL2ACFG[0...3]x00000058 (IOMMUL2::L2_ITC_WAY_CONTROL)

Read-write. Reset: 0000_0000h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000058; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000058; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:16	ITCWayAccessDisable . Read-write. Reset: 0000h. Used with ITCWayDisable to disable a way of set associativity.
15:0	ITCWayDisable . Read-write. Reset: 0000h. Each bit in this register disables a way in the ITC when set to 1. An implementation may have less than 32 ways. The entire cache may be disabled by setting the ITCWays lower bits of this register.

IOMMUL2ACFG[0...3]x00000060 (IOMMUL2::L2_PTC_A_CONTROL)

Reset: D008_C312h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000060; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000060; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:28	PTCAEntries. Read-only. Reset: Dh. The number of entries in the PTC A sub-cache is indicated as $2^{\text{PTCAEntries}}$.
27:24	Reserved.
23:16	PTCAWays. Read-only. Reset: 08h. Indicates the number of ways in the PTC A sub-cache.
15	PTCAParitySupport. Read-only. Reset: 1. Description: 0=The PTC A sub-cache does not support parity protection. 1=The PTC A sub-cache supports parity protection.
14	PTCAFastInvalidateGuest. Read-write. Reset: 1. When set, SW-issued page invalidations with GN=0 will perform fast-imprecise invalidation for all guest TLB entries matching Domain_id[1:0] for PTC A sub-cache.
13	PTCABypass. Read-write. Reset: 0. When set, all requests bypass the PTC A sub-cache.
12	PCTA_Inv_Overlapping_Pages. Read-write. Reset: 0. When set, the PTC A sub-cache will invalidate all pages which contain address range of IOMMU page invalidation. When 0, cached page must be fully within IOMMU page invalidation range.
11	PTCA2MMode. Read-write. Reset: 0. When set, the PTC A sub-cache stores 2M pages instead of 4K pages.
10	PTCASoftInvalidate. Read-write. Reset: 0. Software may write this register to 1 to invalidate all entries in the PTC A sub-cache.
9:8	PTCAInvalidationSel. Read-write. Reset: 3h. Description: Selects the PTC A sub-cache invalidation algorithm. 00=Invalidate the entire PTC A sub-cache 01=Fast imprecise invalidation 10=Sequential precise invalidation 11=Partial sequential precise invalidation.
7:5	Reserved.
4	PTCAParityEn. Read-write. Reset: 1. Enable parity protection of the PTC A sub-cache.
3	PTCALRUUpdatePri. Read-write. Reset: 0. Description: 0=Reads update replacement state bits when there is a simultaneous read and write to the same PTCA index. 1=Writes update replacement state bits when there is a simultaneous read and write to the same PTCA index.
2	PTCAStorePartialATSeperate. Read-write. Reset: 0. When set ATS translation requests can only hit partial cache entry populated by another ATS translations request.
1	PTCAStoreFinalATSeperate. Read-write. Reset: 1. When set ATS translation requests can only hit final cache entry populated by another ATS translations request.
0	Reserved.

IOMMUL2ACFG[0...3]x00000064 (IOMMUL2::L2_PTC_A_HASH_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000064; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000064; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:16	PTCAAddressMask. Read-write. Reset: 0000h. This register is a bit-wise AND mask that selects which virtual address bits are used to index into the PTC A sub-cache.
15:0	Reserved.

IOMMUL2ACFG[0...3]x00000068 (IOMMUL2::L2_PTC_A_WAY_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000068; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000068; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:16	PTCAWayAccessDisable. Read-write. Reset: 0000h. Used with PTCWayDisable to disable a way of set associativity.
15:0	PTCAWayDisable. Read-write. Reset: 0000h. Each bit in this register disables a way in the PTC A sub-cache when set to 1. An implementation may have less than 32 ways. The entire cache may be disabled by setting the PTCAWays lower bits of this register.

IOMMUL2ACFG[0...3]x00000070 (IOMMUL2::L2_RT_CONTROL_0)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000070; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000070; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:22	Reserved.
21:20	PDC_CLIENTS_ARB_CTRL. Read-write. Reset: 0h. Controls the arbitration scheme of PDC clients buffer. 0= Requests marked as QoS always wins(default). 1=QoS and Non-QoS requests are round-robbined. Bit [0] = DTC Hit buffer, Bit[1] = DTE TW buffer.
19	Reserved.
18:16	PTC_CLIENTS_ARB_CTRL. Read-write. Reset: 0h. Controls the arbitration scheme of buffers inside PTC Processor. 0= Requests marked as QoS always wins(default). 1=QoS and Non-QoS requests are round-robbined. Bit [0] = DTC Hit buffer, Bit[1] = PTC Feedback buffer, Bit[2] = DTE TW buffer.
15:8	IFIFO_CLIENTS_ARB_CTRL. Read-write. Reset: 00h. Controls the arbitration scheme within L1's traffic class inside IFIFO. The register is one-hot encoding per L1 with 0= Requests marked as QoS always wins over non-QoS requests within that L1(default). 1=QoS and Non-QoS requests from given L1 are round-robbined. Number of bits used are project dependent
7:5	Reserved.
4:0	FLTCMB_CLIENTS_ARB_CTRL. Read-write. Reset: 00h. Controls the arbitration scheme of buffers inside Fault Combiner. 0= Requests marked as QoS always wins(default). 1=QoS and Non-QoS requests are round-robbined. Bit [0] = DTE/ITE Table Walker buffer, Bit[1] = DTC Hit buffer, Bit[2] = PTC hit buffer, Bit[3]=Page Table Walker buffer, Bit[4] = PDC hit buffer.

IOMMUL2ACFG[0...3]x00000088 (IOMMUL2::L2A_UPDATE_FILTER_CNTL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000088; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000088; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:1	Reserved.
0	L2a_Update_Filter_Bypass. Read-write. Reset: 0. Description: 1=Disable duplicate update filtering; 0=Enable the dropping of updates that are already in the l2a_update_filter or in the destination l2a cache.

IOMMUL2ACFG[0...3]x000000C0 (IOMMUL2::L2_ERR_RULE_CONTROL_3)

Reset: 0000_0000h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x000000C0; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x000000C0; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:4	ERRRuleDisable3. Read-write. Reset: 000_0000h. Each bit in this register disables an error detection rule in the IOMMU.
3:1	Reserved.
0	ERRRuleLock1. Write-once. Reset: 0. This register is write-once. Setting this register bit locks the error detection rule set in ERRRuleDisable3/4/5.

IOMMUL2ACFG[0...3]x000000C4 (IOMMUL2::L2_ERR_RULE_CONTROL_4)

Read-write. Reset: 0000_0000h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x000000C4; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x000000C4; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:0	ERRRuleDisable4. Read-write. Reset: 0000_0000h. Each bit in this register disables an error detection rule in the IOMMU.

IOMMUL2ACFG[0...3]x000000C8 (IOMMUL2::L2_ERR_RULE_CONTROL_5)

Read-write. Reset: 0000_0000h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x000000C8; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x000000C8; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:0	ERRRuleDisable5. Read-write. Reset: 0000_0000h. Each bit in this register disables an error detection rule in the IOMMU.

IOMMUL2ACFG[0...3]x000000CC (IOMMUL2::L2_L2A_CK_GATE_CONTROL)

Read-write. Reset: 0005_0007h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x000000CC; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x000000CC; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:21	Reserved.
20	CKGateL2APortClkDis. Read-write. Reset: 0. 0=L2A ingress port ClkReq will wake up clocks. 1=L2A clocks will wake up after port traffic is received.
19:18	CKGateL2AStop. Read-write. Reset: 1h. Description: 0=allow 2 clock cycles delay before stopping the clocks when clkready deasserts 1=allow 4 clock cycles delay before stopping the clocks when clkready deasserts 2=allow 8 clock cycles delay before stopping the clocks when clkready deasserts 3=allow 16 clock cycles delay before stopping the clocks when clkready deasserts
17:16	CKGateL2ALength. Read-write. Reset: 1h. Description: 0=allow 128 clock cycles delay before stopping the clocks when idle asserts 1=allow 256 clock cycles delay before stopping the clocks when idle asserts 2=allow 512 clock cycles delay before stopping the clocks when idle asserts 3=allow 1024 clock cycles delay before stopping the clocks when idle asserts
15:4	Reserved.
3	CKGateL2APerfDisable. Read-write. Reset: 0. Disable the gating of the l2a non-architected performance counters.
2	CKGateL2ACacheDisable. Read-write. Reset: 1. Init: 0. Disable the gating of the l2a upper cache ways.
1	CKGateL2ADynamicDisable. Read-write. Reset: 1. Init: 0. Disable the gating of the l2a dynamic clock branch.
0	CKGateL2ARegsDisable. Read-write. Reset: 1. Init: 0. Disable the gating of the l2a register clock branch.

IOMMUL2ACFG[0...3]x000000D0 (IOMMUL2::L2_L2A_PGSIZE_CONTROL)

Read-write. Reset: 0002_4949h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x000000D0; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x000000D0; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:20	Reserved.
19:17	L2AREG_PTCSCAN_MODE. Read-write. Reset: 1h. Description: Defines the order in which the different page size for host and guest are to be looked up. Current enabled modes are 000b=Legacy PTC lookup mode. Each translation request triggers back-to-back PTC lookups for different sizes based on L2AREG_HOST_PGSIZE and L2AREG_GUEST_PGSIZE registers Remaing encodings enable PTC feedback mode where each translation request triggers page size lookup through PTC based on the order specified by the encoding.For a miss, it is fed back into PTC with next page size in the order. 001b=PTC feedback scan mode order 4KB,2MB,1G. 010b=PTC feedback scan mode order 2MB,4KB,1G. All other encodings are reserved. For Logically Partitioned TLB: 000b=Legacy PTC lookup mode. All other encodings are Feedback scan mode.
16:15	Reserved.
14:8	L2AREG_HOST_PGSIZE. Read-write. Reset: 49h. Description: Controls the TLB search for different (final and partial) host page sizes. Bit 0 = 4k final TLB look up enabled(cannot be disabled) Bit 3 = 2MB partial and final TLB look up enabled Bit 6 = 1GB partial and final TLB look up enabled All other bits are reserved.The register is used when L2AREG_PTCSCAN_MODE=000b
7	Reserved.
6:0	L2AREG_GST_PGSIZE. Read-write. Reset: 49h. Description: Controls the TLB search for different (final and partial) guest page sizes. Bit 0 = 4k final TLB look up enabled(cannot be disabled) Bit 3 = 2MB partial and final TLB look up enabled Bit 6 = 1GB partial and final TLB look up enabled. All other bits are reserved. The register is used when L2AREG_PTCSCAN_MODE=000b

IOMMUL2ACFG[0...3]x000000F8 (IOMMUL2::L2_PWRGATE_CNTRL_REG_0)

Read-write. Reset: 0000_03E8h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x000000F8; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x000000F8; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:0	IP_PG_thres. Read-write. Reset: 0000_03E8h. Idle threshold before entering power gating.

IOMMUL2ACFG[0...3]x00000104 (IOMMUL2::L2_PWRGATE_CNTRL_REG_3)

Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000104; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000104; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:5	Reserved.
4:3	CFG_FW_PG_EXIT_EN. Read-write. Reset: 0h. <RW> 2'x1: enable sending the pwrmgr_int for FW interlock feature, 2'b1x: Enable wakeup tile from power gated state using the pwrmtg_int_clear signal
2	L2_PG_STATUS. Read-only. Reset: 0. SW readable register for finding the PG status of the L2, 0 - not PG, 1 - power-gated
1	IP_PG_busy. Read-only. Reset: 0. High entering or leaving PG.
0	IP_PG_en. Read-write. Reset: 0. 1 = Enabled L2 power gating.

IOMMUL2ACFG[0...3]x00000118 (IOMMUL2::L2_ERR_RULE_CONTROL_6)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000118; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

Bits	Description
31:0	ERRRuleDisable7 . Read-write. Reset: 0000_0000h. Each bit in this register disables an error detection rule in the IOMMU.

IOMMUL2ACFG[0...3]x00000120 (IOMMUL2::L2_ERR_RULE_CONTROL_8)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2ACFG[1:0]x00000120; IOMMUL2ACFG[1:0]=15[8:7]0_0000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2ACFG[3:2]x00000120; IOMMUL2ACFG[3:2]=15[A:9]0_0000h

Bits	Description
31:0	ERRRuleDisable8 . Read-write. Reset: 0000_0000h. Each bit in this register disables an error detection rule in the IOMMU.

IOMMUL2B[0...3]x0000011C (IOMMUL2::L2_MISC_CNTRL_3)

Read-write. Reset: 0000_0007h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x0000011C; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x0000011C; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:20	Reserved.
19	REG_L2_NW_CTRL . Read-write. Reset: 0. Description: NW_bit_Enable - 0x1 = Keep NW low at the input of pdc_cache for implicit upgrade. 0x0 = Forward NW bit from the input ATS request.
18:6	Reserved.
5	REG_vIOMMU_IntFilter_En . Read-write. Reset: 0. Enables filtering of vIOMMU Interrupts before they are sent out to the L2A
4	REG_PPR_StrictOrder_En . Read-write. Reset: 0. Enables strict ordering of legacy PPR and vIOMMU virtual PPR requests
3	Reserved.
2	REG_atomic_filter_en . Read-write. Reset: 1. TW atomic filter enable.
1	REG_mask_il2_nw . Read-write. Reset: 1. Value = 1 Mask il2_nw with L2PDE_L2TW_vaoffset[0].
0	REG_ats_iw . Read-write. Reset: 1. Ignore Write permission checks for ATS requests.

IOMMUL2B[0...3]x0000012C (IOMMUL2::L2_SB_LOCATION)

Read-write. Reset: 0000_0000h.

Specifies which PCIE bridge is connected to the SB. Register set to 32'b0 indicates the GNB is secondary and has no SB connected.

`_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x0000012C; IOMMUL2B[1:0]=1[40:3F]0_1000h``_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x0000012C; IOMMUL2B[3:2]=14[2:1]0_1000h`

Bits	Description
31:16	SBlocated_Core. Read-write. Reset: 0000h. Description: One hot encoding: 0x1 - SB is under GPP0 0x2 - SB is under GPP1 0x4 - SB is under GPP2 All other encodings are reserved.
15:0	SBlocated_Port. Read-write. Reset: 0000h. Description: One hot encoding: 0x1 - SB is located on port A of SBlocated_Core 0x2 - SB is located on port B of SBlocated_Core 0x4 - SB is located on port C of SBlocated_Core 0x8 - SB is located on port D of SBlocated_Core All other encodings are reserved.

IOMMUL2B[0...3]x00000130 (IOMMUL2::L2_CONTROL_5)

Read-write. Reset: 2804_9001h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000130; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000130; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:26	L2B_L2A_v1_trans_credits. Read-write. Reset: 0Ah. controls credits for L2B to L2A v1 trans interface
25	DTCUpdatePri. Read-write. Reset: 0. 0=Do not cache DTEs fetch by PRI requests. 1=Cache DTEs fetched by PRI requests. In order to enable this bit, software should ensure that it marks the DTE invalid in the memory prior to issuing Device Invalidation.
24:21	Reserved.
20	STORE_PDPE_QOS_PTC. Read-write. Reset: 0. Allow caching Guest PDPE SPA pointer to be cached in QOS PTC cache.
19	Reserved.
18:12	GST_partial_ptc_cntrl. Read-write. Reset: 49h. Each bit controls which level of Guest Page Directory SPA pointer is allowed to be cached in PTC. Bit 3: SPA pointer to PTE . Bit 6: SPA pointer to PDE. All other bits are reserved
11	ForceTWonVCQoS. Read-write. Reset: 0. Force table walk fetches to use VC5 for all VC0/1 and VC5 DMA requests
10:7	Reserved.
6	FC3Dis. Read-write. Reset: 0. Description: 0=FC3 flow-control loop is enabled. 1=FC3 flow-control loop is disabled.
5	Reserved.
4	DTCUpdateVZeroIVOne. Read-write. Reset: 0. Description: 0=DTEs with V=0 and IV=1 are not cached in the DTC. 1=DTEs with V=0 and IV=1 are cached in the DTC.
3	DTCUpdateVOneIVZero. Read-write. Reset: 0. Description: 0=DTEs with V=1 and IV=0 are not cached in the DTC. 1=DTEs with V=1 and IV=0 are cached in the DTC.
2	FC1Dis. Read-write. Reset: 0. Description: 0=FC1 flow control loop enabled. 1=FC1 flow control loop disabled.
1	Reserved.
0	QueueArbFBPri. Read-write. Reset: 1. Description: 0=Requests in the miss queue and the feedback queue are arbitrated in a round-robin manner. 1=Requests in the feedback queue are given priority over requests in the miss queue.

IOMMUL2B[0...3]x0000013C (IOMMUL2::L2_CONTROL_6)

Read-write. Reset: 0001_0808h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x0000013C; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x0000013C; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:24	Perf2Threshold. Read-write. Reset: 00h. Fifo threshold level used to calculate certain performance counter values.
23:17	Reserved.
16	SeqInvBurstLimitEn. Read-write. Reset: 1. Enable stalling PDC requests to allow invalidation cycles to make forward progress based upon SeqInvBurstLimitInv and SeqInvBurstLimitPDCReq.
15:8	SeqInvBurstLimitPDCReq. Read-write. Reset: 08h. Sets the number of consecutive PDC requests to perform when doing sequential invalidation. PDC and invalidation requests alternate access to the PDC based upon SeqInvBurstLimitInv and SeqInvBurstLimitPDCReq.
7:0	SeqInvBurstLimitInv. Read-write. Reset: 08h. Sets the number of consecutive invalidation requests to perform when doing sequential invalidation. PDC and invalidation requests alternate access to the PDC based upon SeqInvBurstLimitInv and SeqInvBurstLimitPDCReq.

IOMMUL2B[0...3]x00000140 (IOMMUL2::L2_PDC_CONTROL)

Reset: D008_C310h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000140; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000140; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:28	PDCEntries . Read-only. Reset: Dh. Indicates the number of entries in the PDC is indicated as $2^{\text{PDCEntries}}$.
27:24	Reserved.
23:16	PDCWays . Read-only. Reset: 08h. Indicates the number of ways in the PDC.
15	PDCParitySupport . Read-only. Reset: 1. Description: 0=The PDC does not support parity protection. 1=The PDC supports parity protection.
14	PDCModeLookupFix . Read-write. Reset: 1. 1=Lookup PDC from level2 to DTE.MODE. 0=Revert this chicken bit to lookup PDC from level2 to DTE.MODE+1.
13	PDCBypass . Read-write. Reset: 0. When set, all requests bypass the PDC. This prevents the multiple issue of requests and increases maximum rate of requests to the table-walker.
12	PDCSearchDirection . Read-write. Reset: 0. Description: 0=Search PDC from higher levels down. 1=Search PDC from lower levels up.
11	PDC_Inv_Overlapping_Pages . Read-write. Reset: 0. When set, the DCP will invalidate all pages which contain address range of IOMMU page invalidation. When 0, cached page must be fully within IOMMU page invalidation range.
10	PDCSoftInvalidate . Read-write. Reset: 0. Software may write this register to 1 to invalidate all entries in the PDC.
9:8	PDCInvalidationSel . Read-write. Reset: 3h. Description: Selects the PDC invalidation algorithm. 00 = Invalidate the entire PDC 01 = Fast imprecise invalidation 10 = Sequential precise invalidation 11 = Partial sequential precise invalidation
7:5	Reserved.
4	PDCParityEn . Read-write. Reset: 1. Enable parity protection of the PDC if the device supports parity.
3	PDCLRUpdatePri . Read-write. Reset: 0. Description: 0=Reads update replacement state bits when there is a simultaneous read and write to the same PDC index. 1=Writes update replacement state bits when there is a simultaneous read and write to the same PDC index.
2:0	Reserved.

IOMMUL2B[0...3]x00000144 (IOMMUL2::L2_PDC_HASH_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000144; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000144; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:16	PDCAddressMask . Read-write. Reset: 0000h. This register is a bit-wise AND mask that selects which virtual address bits are used to index into the PDC.
15:0	Reserved.

IOMMUL2B[0...3]x00000148 (IOMMUL2::L2_PDC_WAY_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000148; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000148; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:16	PDCWayAccessDisable. Read-write. Reset: 0000h. Used with PDCWayDisable to disable a way of set associativity.
15:0	PDCWayDisable. Read-write. Reset: 0000h. Each bit in this register disables a way in the PDC when set to 1. An implementation may have less than 32 ways. The entire cache may be disabled by setting the PDCWays lower bits of this register.

IOMMUL2B[0...3]x0000014C (IOMMUL2::L2B_UPDATE_FILTER_CNTL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x0000014C; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x0000014C; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:1	Reserved.
0	L2b_Update_Filter_Bypass. Read-write. Reset: 0. Description: 1 = Disable duplicate update filtering; 0 = Enable the dropping of updates that are already in the l2b_update_filter or in the PDC.

IOMMUL2B[0...3]x00000150 (IOMMUL2::L2_TW_CONTROL)

Read-write. Reset: 0200_1100h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000150; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000150; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:26	Reserved.
25	TWCacheNestedPTE . Read-write. Reset: 1. 1-Enables storing Nested PTEs (2MB and larger) in PDC. 0-Disable storing Nested PTEs in PDC (default)
24:19	Reserved.
18	TWContWalkOnPErrDis . Read-write. Reset: 0. Description: 0=Continue walking tables on a write permission error. 1=Stop walking on a write permission error.
17	TWFilter_64B_Dis . Read-write. Reset: 0. 1=Table Walker memory reads are 16B. 0=Table Walker memory reads are 64B.
16	TWFilter_Dis . Read-write. Reset: 0. Disables filtering within Table Walker of memory read requests to same address.
15	Reserved.
14:12	TWPrefetchRange . Read-write. Reset: 1h. Selects the number of pages to prefetch.
11	TWPTEOnAddrTransExcl . Read-write. Reset: 0. Description: 0=Table walker returns DTE to L1 on an address translation exclusion range access. 1=Table walker returns PTE to L1 on an address translation exclusion range access.
10	TWPTEOnUntransExcl . Read-write. Reset: 0. Description: 0=Table walker returns DTE to L1 on an untranslated exclusion range access. 1=Table walker returns PTE to L1 on an untranslated exclusion range access.
9	TWPrefetchOnly4KDis . Read-write. Reset: 0. Description: 1=Allow non-4K pages to be prefetched. 0=Only 4K pages are prefetched.
8	TWPrefetchEn . Read-write. Reset: 1. Enable HW host prefetching in the table-walker.
7	Reserved.
6	TWForceCoherent . Read-write. Reset: 0. 1=Table-walker always generates coherent requests. The DTE SD bit is ignored when this bit is set to 1.
5:0	Reserved.

IOMMUL2B[0...3]x00000158 (IOMMUL2::L2_CP_CONTROL)

Read-write. Reset: 0000_0012h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000158; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000158; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:16	CPRdDelay . Read-write. Reset: 0000h. Command processor read delay.
15:6	Reserved.
5	CPForceOneOutstandingCommand . Read-write. Reset: 0. 1=Force 1 outstanding command to each L1 from the L2 CP Master. 0=Can have multiple commands processing in each L1 originating from the L2 CP Master.
4	CPForceReqPassPW . Read-write. Reset: 1. Set the value for CP ReqPassPW interface signal for Command Buffer reads.
3	Reserved.
2	CPFlushOnInv . Read-write. Reset: 0. Description: 1=Command processor flushes out old requests on every invalidation command. 0=No flush is performed during invalidations.
1	CPFlushOnWait . Read-write. Reset: 1. Description: 1=Command processor flushes out old requests on completion wait. 0=No flush is performed on completion wait.
0	CPPrefetchDis . Read-write. Reset: 0. Description: 1=Command processor fetches and executes only one command at a time 0=Command processor prefetches available commands into its internal storage.

IOMMUL2B[0...3]x0000015C (IOMMUL2::L2_CP_CONTROL_1)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x0000015C; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x0000015C; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:16	Reserved.
15:0	CPL1Off . Read-write. Reset: 0000h. Each bit in this register indicates to the IOMMU command processor that a corresponding L1 TLB is inaccessible due to static clock or power gating. System software is responsible for programming this register.

IOMMUL2B[0...3]x000001A8 (IOMMUL2::L2_CONTROL_7)

Read-write. Reset: 0000_0020h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000001A8; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000001A8; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:12	Reserved.
11:0	PCTRL_hysteresis . Read-write. Reset: 020h. Hysteresis for full disconnect initiation of sdp ports.

IOMMUL2B[0...3]x000001C0 (IOMMUL2::L2_CREDIT_CONTROL_0)

Read-write. Reset: 0000_0000h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000001C0; IOMMUL2B[1:0]=1[40:3F]0_1000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000001C0; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:22	Reserved.
21	FC3Override. Read-write. Reset: 0. Changing this register from 0 to 1 overrides the FC3 credit counter with FC3Credits. This should only be performed when the IOMMU is idle.
20:15	FC3Credits. Read-write. Reset: 00h. FC3 credit override value.
14:8	Reserved.
7	FC1Override. Read-write. Reset: 0. Changing this register from 0 to 1 overrides the FC1 credit counter with FC1Credits. This should only be performed when the IOMMU is idle.
6:0	FC1Credits. Read-write. Reset: 00h. FC1 credit override value.

IOMMUL2B[0...3]x000001C4 (IOMMUL2::L2_CREDIT_CONTROL_1)

Read-write. Reset: 0044_0000h.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000001C4; IOMMUL2B[1:0]=1[40:3F]0_1000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000001C4; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:24	Reserved.
23:20	PPR_MCIF_credits. Read-write. Reset: 4h. PPR logger credit override value.
19:16	CP_PREFETCH_credits. Read-write. Reset: 4h. Command processor prefetch credit override value.
15:0	Reserved.

IOMMUL2B[0...3]x000001D0 (IOMMUL2::L2_VC_CONTROL_0)

Read-write. Reset: 2404_C26Ch.

_johub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000001D0; IOMMUL2B[1:0]=1[40:3F]0_1000h

_johub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000001D0; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31	L2IMU_TRANS_pri. Read-write. Reset: 0. 1=Use QOS TW path for IOMMU internal translations. 0=Use none-QOS TW path for IOMMU internal translations.
30	L2IMU_GSTINT_pri. Read-write. Reset: 0. 1=Use QOS TW path for IOMMU internal interrupt translations. 0=Use none-QOS TW path for IOMMU internal interrupt translations.
29:27	VIOMMU_VC. Read-write. Reset: 4h. VC used for VIOMMU private spaces access.
26:24	VF_MMIO_VC. Read-write. Reset: 4h. VC used for vIOMMU private space MMIO access.
23:21	CP_VC. Read-write. Reset: 0h. VC used for HV CP queue access.
20:18	PPRLOG_VC. Read-write. Reset: 1h. VC used for PPR LOG access.
17:15	GALOG_VC. Read-write. Reset: 1h. VC used for GALOG access.
14:12	AVIC_VC. Read-write. Reset: 4h. VC used for AVIC TW.
11:9	EVENTLOG_VC. Read-write. Reset: 1h. VC used for event logger.
8:6	CMPL_WB_VC. Read-write. Reset: 1h. VC used for Command processor completion write backs.
5:3	TW_QOS_VC. Read-write. Reset: 5h. VC used for QOS table walker memory access.
2:0	TW_VC. Read-write. Reset: 4h. VC used for table walker memory access.

IOMMUL2B[0...3]x00000200 (IOMMUL2::L2_ERR_RULE_CONTROL_0)

Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000200; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000200; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:1	ERRRuleDisable0. Read-write. Reset: 0000_0000h. Each bit in this register disables an error detection rule in the IOMMU.
0	ERRRuleLock0. Write-once. Reset: 0. This register is write-once. Setting this register bit locks the error detection rule set in ERRRuleDisable0/1/2.

IOMMUL2B[0...3]x00000204 (IOMMUL2::L2_ERR_RULE_CONTROL_1)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000204; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000204; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:0	ERRRuleDisable1. Read-write. Reset: 0000_0000h. Each bit in this register disables an error detection rule in the IOMMU.

IOMMUL2B[0...3]x00000208 (IOMMUL2::L2_ERR_RULE_CONTROL_2)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000208; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000208; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:0	ERRRuleDisable2. Read-write. Reset: 0000_0000h. Each bit in this register disables an error detection rule in the IOMMU.

IOMMUL2B[0...3]x00000240 (IOMMUL2::L2_L2B_CK_GATE_CONTROL)

Read-write. Reset: 0005_000Fh.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000240; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000240; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:20	Reserved.
19:18	CKGateL2BStop. Read-write. Reset: 1h. Description: 0=allow 2 clock cycles delay before stopping the clocks when clkready deasserts 1=allow 4 clock cycles delay before stopping the clocks when clkready deasserts 2=allow 8 clock cycles delay before stopping the clocks when clkready deasserts 3=allow 16 clock cycles delay before stopping the clocks when clkready deasserts
17:16	CKGateL2BLength. Read-write. Reset: 1h. Description: 0=allow 128 clock cycles delay before stopping the clocks when idle asserts 1=allow 256 clock cycles delay before stopping the clocks when idle asserts 2=allow 512 clock cycles delay before stopping the clocks when idle asserts 3=allow 1024 clock cycles delay before stopping the clocks when idle asserts
15:7	Reserved.
6	CKGateL2BPortClkDis. Read-write. Reset: 0. 0=L2B ingress port ClkReq will wake up clocks. 1=L2B clocks will wake up after port traffic is received.
5	CKGateL2BPerfDisable. Read-write. Reset: 0. Disable the gating of the l2b non-architected performance counters.
4	CKGateL2BAPCDisable. Read-write. Reset: 0. Disable the gating of the l2b architected performance counters.
3	CKGateL2BCacheDisable. Read-write. Reset: 1. Init: 0. Disable the gating of the l2b upper cache ways.
2	CKGateL2BMiscDisable. Read-write. Reset: 1. Init: 0. Disable the gating of the l2b miscellaneous clock branch.
1	CKGateL2BDynamicDisable. Read-write. Reset: 1. Init: 0. Disable the gating of the l2b dynamic clock branch.
0	CKGateL2BRegsDisable. Read-write. Reset: 1. Init: 0. Disable the gating of the l2b register clock branch.

IOMMUL2B[0...3]x00000248 (IOMMUL2::PPR_CONTROL)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000248; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000248; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:17	Reserved.
16	PPR_IntCoalesce_En. Read-write. Reset: 0. Enables interrupt coalescing. Set to 1 if PPR_IntTimeDelay and PPR_IntReqDelay are not 0.
15:8	PPR_IntReqDelay. Read-write. Reset: 00h. Minimum number of PPR requests for new interrupt to be generated.
7:0	PPR_IntTimeDelay. Read-write. Reset: 00h. Minimum time before new interrupt generated for consecutive PPR, counted in multiples of 50 us after the first PPR request is received. An interrupt will be sent and the timer cleared if PPR_IntReqDelay PPR requests are received before the timer elapses.

IOMMUL2B[0...3]x00000250 (IOMMUL2::L2_L2B_PGFSIZE_CONTROL)

Read-write. Reset: 0000_4949h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000250; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000250; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:15	Reserved.
14:8	L2BREG_HOST_PGFSIZE. Read-write. Reset: 49h. Description: Controls the allowed Host PTE sizes stored in PTC cache. Following are the valid programming bit values for this register bit 0 = Enable 4k (4k is always on..cannot be disabled) bit 3 = Enable 2M final host page size caching bit 6 = Enabled 1G final host page size caching. All other bits are reserved.
7	Reserved.
6:0	L2BREG_GST_PGFSIZE. Read-write. Reset: 49h. Description: Controls the allowed Guest PTE sizes stored in PTC cache. Following are the valid programming bit values for this register bit 0 = Enable 4k (4k is always on..cannot be disabled) bit 3 = Enable 2M final guest page size caching bit 6 = Enabled 1G final guest page size caching If a given final page size is disabled, next enabled lowest page size will be cached. All other bits are reserved

IOMMUL2B[0...3]x00000280 (IOMMUL2::L2B_SDP_REQ_MAXCRED)

Read-write. Reset: FFFF_FFFFh.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000280; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000280; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:16	L2B_WRRSP_MAXCRED. Read-write. Reset: FFFFh. Max credits to be released for L2IMU_IOHC_WrRsp interface. L2B_WRRSP[3:0] represents max credits on VC0. L2B_WRRSP[7:4] represents max credits on VC1
15:0	L2B_RDRSP_MAXCRED. Read-write. Reset: FFFFh. Max credits to be released for L2IMU_IOHC_RdRsp interface. L2B_RDRSP[3:0] represents max credits on VC0. L2B_RDRSP[7:4] represents max credits on VC4. L2B_RDRSP[11:8] represents max credits on VC5. L2B_RDRSP[15:12] represents max credits on VC7

IOMMUL2B[0...3]x00000284 (IOMMUL2::L2B_SDP_RSP_MAXCRED)

Read-write. Reset: 8800_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000284; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000284; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:28	L2B_DATA_MAXCRED . Read-write. Reset: 8h. Max credits to be released for iohc_l2_data interface
27:24	L2B_REQ_MAXCRED . Read-write. Reset: 8h. Max credits to be released for iohc_l2_req interface
23:0	Reserved.

IOMMUL2B[0...3]x00000288 (IOMMUL2::L2B_SDP_PARITY_ERROR_EN)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x00000288; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x00000288; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:5	Reserved.
4	MSG_PARITY_ERROR_EN . Read-write. Reset: 0. Enables the parity check on incoming data to the MSG Processor .
3	VFMMIO_PARITY_ERROR_EN . Read-write. Reset: 0. Enables the parity check on incoming data to the VFMMIO Processor .
2	TWW_PARITY_ERROR_EN . Read-write. Reset: 0. Enables the parity check on incoming data to the TW.
1	CP_PARITY_ERROR_EN . Read-write. Reset: 0. Enables the parity check on incoming data to the CP.
0	Reserved.

IOMMUL2B[0...3]x000002A8 (IOMMUL2::L2_RT_CONTROL_CTRL_0)

Read-write. Reset: 0000_4000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002A8; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002A8; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:16	Reserved.
15:7	FC1_RT_Credits . Read-write. Reset: 080h. Number of credits reserved for RT traffic for FC1 credits. This register should only be set when IOMMU Idle. IOMMU behaviour is undefined for non-Idle scenarios.
6	FC1_RT_Override . Read-write. Reset: 0. Changing this register from 0 to 1 overrides the RT FC1 credit counter with FC1_RT_Credits. This should only be performed when the IOMMU is idle.
5:4	PTW_CLIENTS_ARB_CTRL . Read-write. Reset: 0h. Controls the arbitration scheme of Page Table Walker clients buffer. 0= Requests marked as QoS always wins(default). 1=QoS and Non-QoS requests are round-robbined. Bit [0] = PTC Miss buffer, Bit[1] = PDC Miss buffer.
3:2	Reserved.
1:0	PDC_CLIENTS_ARB_CTRL . Read-write. Reset: 0h. Controls the arbitration scheme of PDC clients buffer. 0= Requests marked as QoS always wins(default). 1=QoS and Non-QoS requests are round-robbined. Bit [0] = Page Table Walker buffer, [1] = PDC lookup feedback buffer

IOMMUL2B[0...3]x000002B4 (IOMMUL2::L2_WQ_CONTROL)

Read-write. Reset: 0000_0007h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002B4; IOMMUL2B[1:0]=1[40:3F]0_1000h

_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002B4; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:9	Reserved.
8	REG_PPR_One_WQ . Read-write. Reset: 0. 1=Disables all but one WQ in the PPRLOGGER. 0=All PPRLOGGER WQs are enabled.
7:3	Reserved.
2:0	REG_GSTCMD_Num_WQs_m1 . Read-write. Reset: 7h. This value + 1 configures the number of WQs enabled in the GST CMD Fetch Processor .

IOMMUL2B[0...3]x000002B8 (IOMMUL2::L2_RIOMMUISP_INVACK_0)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002B8; IOMMUL2B[1:0]=1[40:3F]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002B8; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:2	RIOMMUISP_INVALIDATION_ITAG_29_0 . Read-write. Reset: 0000_0000h. Bits 29 to 0 of invalidation ack itag mask. Indicates which outstanding invalidations are being acknowledged.
1:0	RIOMMUISP_INVALIDATION_STATUS . Read-write. Reset: 0h. 2'b00=Invalidation was successful. 2'b01=Invalidation was unsuccessful. 2'b1x=Reserved.

IOMMUL2B[0...3]x000002BC (IOMMUL2::L2_RIOMMUISP_INVACK_1)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002BC; IOMMUL2B[1:0]=1[40:3F]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002BC; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:2	Reserved.
1:0	RIOMMUISP_INVALIDATION_ITAG_31_30 . Read-write. Reset: 0h. Bits 31 to 30 of invalidation ack itag mask. Indicates which outstanding invalidations are being acknowledged.

IOMMUL2B[0...3]x000002C0 (IOMMUL2::L2_RIOMMUISP_FAULTNOTIF_0)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002C0; IOMMUL2B[1:0]=1[40:3F]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002C0; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:0	RIOMMUISP_EVENTLOG_DATAWORD_0 . Read-write. Reset: 0000_0000h. Write will trigger riommu to main IOMMU eventlog dataword 0 forwarding.

IOMMUL2B[0...3]x000002C4 (IOMMUL2::L2_RIOMMUISP_FAULTNOTIF_1)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002C4; IOMMUL2B[1:0]=1[40:3F]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002C4; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:0	RIOMMUISP_EVENTLOG_DATAWORD_1 . Read-write. Reset: 0000_0000h. Write will trigger riommu to main IOMMU eventlog dataword 1 forwarding.

IOMMUL2B[0...3]x000002C8 (IOMMUL2::L2_RIOMMUISP_FAULTNOTIF_2)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002C8; IOMMUL2B[1:0]=1[40:3F]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002C8; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:0	RIOMMUISP_EVENTLOG_DATAWORD_2 . Read-write. Reset: 0000_0000h. Write will trigger riommu to main IOMMU eventlog dataword 2 forwarding.

IOMMUL2B[0...3]x000002CC (IOMMUL2::L2_RIOMMUISP_FAULTNOTIF_3)

Read-write. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUL2B[1:0]x000002CC; IOMMUL2B[1:0]=1[40:3F]0_1000h_iohub[1:0]_nbio1_aliasSMN; IOMMUL2B[3:2]x000002CC; IOMMUL2B[3:2]=14[2:1]0_1000h

Bits	Description
31:0	RIOMMUISP_EVENTLOG_DATAWORD_3 . Read-write. Reset: 0000_0000h. Write will trigger riommu to main IOMMU eventlog dataword 3 forwarding.

IOMMUL2B[0...3]x000002D0 (IOMMUL2::L2_RIOMMUDCN_INVACK_0)

Read-write. Reset: 0000_0000h.

Bits	Description
31:30	PPRQ. Read-write. Reset: 0h. Description: 0x0=Use default queue A for PPR logger with autoswap disabled. 0x1=Use queue B for PPR logger with autoswap disabled. 0x2=Autoswap is enabled, always start with queue A after reset.
29	GA_INT_EN. Write-1-to-clear. Reset: 0. Guest virtual APIC interrupt enable. 0 = An interrupt is not signalled when IOMMUMMIO::IOMMU_MMIO_STATUS_0[GA_INT] changes from 0 to 1. 1 = An interrupt is signaled when IOMMUMMIO::IOMMU_MMIO_STATUS_0[GA_INT] changes from 0 to 1 using IOMMUL2::IOMMU_CAP_MISC_1[IOMMU_MSI_NUM_GA]. Writes to this bit are ignored when IOMMUMMIO::IOMMU_MMIO_EFR_0[GA_SUP] = 0.
28	GA_LOG_EN. Read-write. Reset: 0. Guest virtual APIC GA Log Enabled. 0 = Disable guest vAPIC virtual interrupt request logging. 1 = Enable GA Logging. Writes to this but are ignored when IOMMUMMIO::IOMMU_MMIO_EFR_0{GASup} = 0.
27:25	GAM_EN. Read-write. Reset: 0h. This field specifies advanced interrupt behaviors and the size of the IRTE.001b=Virtual interrupt behavior as defined by the AVIC specification.
24	SMIF_LOG_EN. Read-write. Reset: 0. If SMI Filtering is enable, send EVENT_LOG when SMI is dropped.
23	Reserved.
22	SMIF_EN. Read-write. Reset: 0. Enable SMI Filtering - Drop SMI from ReqID not found in the SMI Filter Registers.
21:18	TLPT. Read-write. Reset: 0h. TLPT[3:0] contains the 4-bit value matched to the PCIe TLP Type field when the PCIe TLP Fmt value indicates the field carries a prefix.
17	GA_EN. Read-write. Reset: 0. Guest APIC enable. 1 = loose. 0 = prohibited.
16	GT_EN. Read-write. Reset: 0. Description: 1=Guest translation may be enabled for a peripheral by programming DTE[GV]. 0=Guest translation disabled. Note: This bit must be programmed to zero when IOMMUMMIO::IOMMU_MMIO_EFR_0[GT_SUP] = 0.
15	PPR_EN. Read-write. Reset: 0. Description: 1=Peripheral page service requests are processed. 0=Peripheral page service requests are treated as invalid device requests. Note: This bit must be programmed to zero when IOMMUMMIO::IOMMU_MMIO_EFR_0[PPR_SUP] = 0.
14	PPR_INT_EN. Read-write. Reset: 0. Description: 1=An interrupt is signaled when IOMMUMMIO::IOMMU_MMIO_STATUS_0[PPR_INT] = 1. 0=An interrupt is not signaled when IOMMUMMIO::IOMMU_MMIO_STATUS_0[PPR_INT] = 1. Note: This bit must be programmed to zero when IOMMUMMIO::IOMMU_MMIO_EFR_0[PPR_SUP] = 0. The interrupt vector used is indicated in Capability Offset 10h[IOMMU_MSI_NUM_PPR].
13	PPR_LOG_EN. Read-write. Reset: 0.

	Description: 1=The PPR Log Base Address Register IOMMUMMIO::IOMMU_MMIO_PPR_BASE_0 has been configured and peripheral page service request events are written to the peripheral page service request log when IommuEn has also been set. Writing a 1b to this bit when PPR_LOG_EN = 1b has no effect. 0=Peripheral page service request logging is not enabled. Peripheral page service requests are discarded when the peripheral page service request log is not enabled OR when IOMMUMMIO::IOMMU_MMIO_EFR_0[PPR_SUP] = 0. When IommuEn = 1b and software writes PPR_LOG_EN with 1b, the IOMMU clears the PPR_LOG_OVERFLOW bit and sets the PPR_RUN bit in the IOMMU Status register IOMMUMMIO::IOMMU_MMIO_STATUS_0. The IOMMU can now write new entries to the event log if there are usable entries available. Note: software can read IOMMUMMIO::IOMMU_MMIO_STATUS_0[PPR_RUN] to determine the status of the peripheral page service request log writing by the IOMMU. Note: the peripheral page service request and event logs are independent. Software note: the PPR Log Base Address register IOMMUMMIO::IOMMU_MMIO_PPR_BASE_0, the IOMMU PPR Log Head Pointer Register IOMMUMMIO::IOMMU_MMIO_PPR_BUF_HDPTR_0, and the IOMMU PPR Log Tail Pointer Register IOMMUMMIO::IOMMU_MMIO_PPR_BUF_TAILPTR_0 must be set prior to enabling the event log.
12	CMD_BUF_EN. Read-write. Reset: 0. Description: 1=Start or restart command buffer processing. When CmdBufEn=1b and IommuEn=1b, the IOMMU starts fetching commands and sets MMIO Offset 2020h[CmdBufRun] to 1b. Writing a 1b to this bit when CmdBufRun=1b has no effect. 0=Halt command buffer processing. Writing a 0 to this bit causes the IOMMU to cease fetching new commands although commands previously fetched are completed. The IOMMU stops fetching commands upon reset and after errors as specified in Table 11. See also MMIO Offset 2020h[CmdBufRun]. Note: see IOMMU Status Register [MMIO Offset 2020h] to determine the status of command buffer processing. Note: writing of event log entries is independently controlled by EventLogEn. Software note: the Command Buffer Base Address Register [MMIO Offset 0008h], the Command Buffer Head Pointer Register IOMMUMMIO::IOMMU_MMIO_CMD_BUF_HDPTR_0[CMD_HDPTR], and the Command Buffer Tail Pointer Register IOMMUMMIO::IOMMU_MMIO_CMD_BUF_TAILPTR_0 must be set prior to enabling the IOMMU command buffer processor.
11	ISOC. Read-write. Reset: 0. Description: This bit controls the state of the isochronous bit in the HyperTransport(TM) read request packet when the IOMMU issues I/O page table reads and device table reads on the HyperTransport(TM) link. 1=Request packet to use isochronous channel. 0=Request packet to use standard channel. Note: Platform firmware should set this bit to 1b for processors that support the isochronous channel.
10	COHERENT. Read-write. Reset: 1. Description: This bit controls the state of the coherent bit in the HyperTransport(TM) read request packet when the IOMMU issues device table reads on the HyperTransport(TM) link. 1=Device table requests are snooped by the processor. 0=Device table requests are not snooped by the processor.
9	RES_PASS_PW. Read-write. Reset: 0. Description: This bit controls the state of the ResPassPW bit in the HyperTransport(TM) read request packet when the IOMMU issues I/O page table reads and device table reads on the HyperTransport(TM) link. 1=Response may pass posted requests. 0=Response may not pass posted requests.
8	PASS_PW. Read-write. Reset: 0. Description: This bit controls the state of the PassPW bit in the HyperTransport(TM) read request packet when the IOMMU issues I/O page table reads and device table reads on the HyperTransport(TM) link. 1=Request packet may pass posted requests. 0=Request packet may not pass posted requests.
7:5	INV_TIMEOUT. Read-write. Reset: 0h.

	Description: This field specifies the invalidation time-out for IOTLB invalidation requests. 000b=No time-out 001b=1 ms 010b=10 ms 011b=100 ms 100b=1 sec. 101b=10 sec. 110b, 111b=Reserved
4	COM_WAIT_INTEN. Read-write. Reset: 0. 1=An interrupt is signalled when IOMMUMMIO::IOMMU_MMIO_STATUS_0[COMWAIT_INT]=1.
3	EVENT_INT_EN. Read-write. Reset: 0. 1=An interrupt is signalled when the EventLogInt bit is set in the IOMMU Status Register IOMMUMMIO::IOMMU_MMIO_STATUS_0.
2	EVENT_LOG_EN. Read-write. Reset: 0. Description: 1=The Event Log Base Address Register IOMMUMMIO::IOMMU_MMIO_EVENT_BASE_0 has been configured and all events detected are written to the event log when IommuEn has also been set. Writing a 1b to this bit when EventLogEn=1b has no effect. 0=Event logging is not enabled. Events are discarded when the event log is not enabled. When IommuEn=1b and software writes EventLogEn with 1b, the IOMMU clears the EventOverflow bit, and sets the EventLogRun bit in the IOMMU Status Register IOMMUMMIO::IOMMU_MMIO_STATUS_0. The IOMMU can now write new entries to the event log if there are usable entries available. Note: software can read MMIO Offset IOMMUMMIO::IOMMU_MMIO_STATUS_0[EVENT_LOGRUN] to determine the status of event log writing by the IOMMU. Note: the fetching of command is independently controlled by CmdBufEn. Software note: the Event Log Base Address Register IOMMUMMIO::IOMMU_MMIO_EVENT_BASE_0, the Event Log Head Pointer Register IOMMUMMIO::IOMMU_MMIO_EVENT_BUF_HDPTR_0, and the Event Log Tail Pointer Register IOMMUMMIO::IOMMU_MMIO_EVENT_BUF_TAILPTR_0 must be set prior to enabling the event log.
1	HT_TUN_EN. Read-write. Reset: 0. Description: 1= Upstream traffic received by the HyperTransport(TM) tunnel is translated by the IOMMU. 0=Upstream traffic received by the HyperTransport(TM) tunnel is not translated by the IOMMU. The IOMMU ignores the state of this bit while IommuEn=0. See also the HtTunnel bit in the IOMMU Capability Header IOMMUL2::IOMMU_CAP_HEADER.
0	IOMMU_EN. Read-write. Reset: 0. Description: 1=IOMMU enabled. All upstream transactions are translated by the IOMMU. The Device Table Base Address Register IOMMUMMIO::IOMMU_MMIO_DEVTBL_BASE_0 must be configured by software before setting this bit. 0=IOMMU is disabled and no upstream transactions are translated or remapped by the IOMMU. When disabled, the IOMMU reads no commands and creates no event log entries. Software note: Software must configure EventLogEn and CmdBufEn.

IOMMUMMIO[0...3]x0000001C (IOMMUMMIO::IOMMU_MMIO_CNTRL_1)

Read-write. Reset: 0000_2200h.

Bits	Description
31:29	SNPAVICEn. Read-write. Reset: 0h. Controls guest virtual APIC mode when the system is SNP-enabled. Supported modes are indicated through MMIO Offset 01A0h[SNPAVICSup]. 000b = Interrupt remapping behavior as defined in Section 2.2.5.2 [Interrupt Virtualization Tables with Guest Virtual APIC Enabled]. Upstream interrupts are remapped using the IRTE entries defined by Figure 17 on page 98 and Table 22 on page 98.001b-111b = reserved values. Treated as SNPAVICEn = 000b.
28	GstBufferTRPMode. Read-write. Reset: 0. Description: 0=IOMMU will calculate base address of buffer algorithmically in the IOMMU private space. The IOMMU private PA will then be translated to System PA using IOMMU v1 page tables.. 1=GCR3 TRP inside DTE is GPA. . 1=GuestX VF Control MMIO Offsets 18h-38h will contain Guest Physical Address of the buffers base address. The GPA will then be translated to System PA using Guest host page tables.
27	IRTECacheDis. Read-write. Reset: 0. 1=Disable IRTE caching. When caching is disabled, software may modify IRTEs in memory without issuing INVALIDATE_INTERRUPT_TABLE commands. Writing this register to 1 does not invalidate prior cached IRTEs. Software must invalidate those using appropriate invalidation commands. Software may detect the presence of this feature by checking that this register bit is writable.
26	GCR3TRPMode. Read-write. Reset: 0. 0=GCR3 TRP inside DTE is SPA. 1=GCR3 TRP inside DTE is GPA.
25	CXLIOEn. Read-write. Reset: 0. Enables Memory Type indication on ATS completion for CXL™ Device
24	PageMigration_EN. Read-write. Reset: 0. 1=Hypervisor Page Migration is enabled
23	GAPPI_EN. Read-write. Reset: 0. 1=Guest APIC Physical Processor Interrupt is enabled when Interrupt Virtualization is enabled
22	V2_HA_Dis. Read-write. Reset: 0. 1 Disable v2 Hardware Access bit update
21	vIommuEn. Read-write. Reset: 0. 1=Enables the virtualized IOMMU for virtualized command, event and PPR processing. 0=All VIOMMU operations are disabled.
20	vCmdEn. Read-write. Reset: 0. 1=VIOMMU Command Fetch Processing is enabled. 0=VIOMMU Command Fetch Processing is disabled.
19	IMUXTInt_EN. Read-write. Reset: 0. Description: 1=IOMMU support for x2APIC interrupt generation is enabled. 0=x2APIC support for internally generate interrupts is disabled.
18	XT_EN. Read-write. Reset: 0. Description: 1=IOMMU Support for x2APIC interrupt information is enabled. Must have IOMMUMMIO::IOMMU_MMIO_CNTRL_0[IOMMU_EN]=1. 0=x2APIC support is disabled.
17	Reserved.
16	V2_HD_Dis. Read-write. Reset: 0. 1 Disable v2 Hardware Dirty bit update.
15:14	HW_Prefetch_AD. Read-write. Reset: 0h. Controls host A/D updates for hardware prefetches.2'b00 Hardware prefetch is not allowed to update v1 Access and Dirty bits (Default).2'b01 Hardware prefetch is allowed to update v1 Access bit, but not allowed to update v1 Dirty bit 2'b10 Reserved (behave as 2'b00).2'b11 Hardware prefetch is allowed to update v1 Access and Dirty bit.
13	EPH_EN. Read-write. Reset: 1. Enables Enhanced PRI Handling Support.
12:11	Reserved.

10	PPR_Auto_resp_AON. Read-write. Reset: 0. Description: Bit used to generate PPR auto responses all the time regardless of the threshold. PPR_Auto_resp_en has to be enabled in order for this to take effect 0x0=0 Regular Auto Response behavior, generate auto responses on buffer full or reaching the threshold based on the setting. 0x1=1 Always generate auto responses when PPR_Auto_resp_en=1, otherwise no effect.
9	Block_StopMark_En. Read-write. Reset: 1. Description: 0=disable blocking stop mark message. 1=enable blocking stop mark message.
8	MARC_en. Read-write. Reset: 0. Description: Memory Address Routing and Control feature Enable. 0 = MARC disabled. 1 = MARC is enabled. When IOMMUMMIO::IOMMU_MMIO_EFR_1[MARCnum]=00b, this feild is reserved.
7	PPR_Auto_resp_en. Read-write. Reset: 0. Enable PPR auto response when PPR near overflow.
6:5	PRIV_ABORT_EN. Read-write. Reset: 0h. Description: Only effective when IOMMUMMIO::IOMMU_MMIO_EFR_1[US_SUP] = 1. 0x3=Reserved 0x2=Future use if DTE enable bit is implemented 0x1=Abort all guest accesses to pages with U/S = 0 (Supervisor Level Only) 0x0=Blind abort is not performed, instead if US_SUP=1, the PMR field from the request is used to check for required permission
4	Reserved.
3:2	DTE_SEG_EN. Read-write. Reset: 0h. Description: 0x0=DTE is 1 segment. Only IOMMU_MMIO_DEVTBL_BASE is used. 0x1=DTE is broken into 2 segments. IOMMU_MMIO_DEVTBL_BASE and IOMMU_MMIO_DEVTBL_1_BASE is used. 0x2=DTE is broken into 4 segments. IOMMU_MMIO_DEVTBL_BASE and IOMMU_MMIO_DEVTBL_1/2/3_BASE is used. 0x3=DTE is broken into 8 segments. All IOMMU_MMIO_DEVTBL<n>_BASE registers are used.
1:0	EVENTQ. Read-write. Reset: 0h. Description: 0x0=Use default queue A for Event logger with autoswap disabled. 0x1=Use queue B for Event logger with autoswap disabled. 0x2=Autoswap is enabled, always start with queue A after reset.

IOMMUMMIO[0...3]x00000020 (IOMMUMMIO::IOMMU_MMIO_EXCL_BASE_0)

Bits	Description
31	sATS_SUP. Read-only. Reset: 1. Description: 0x0=Hardware does not support sATS. 0x1 = Hardware supports sATS.
30	Reserved.
29:28	EVENTF. Read-only. Reset: 2h. Description: 0x0=Event log dual buffer autoswap not supported 0x1=Event log dual buffer supported without autoswap 0x2=Event log dual buffer autoswap supported All other encodings reserved.
27:26	GAF. Read-only. Reset: Fixed,0h. Description: 0x0=GA log dual buffer autoswap not supported 0x1=GA log dual buffer supported without autoswap 0x2=GA log dual buffer autoswap supported All other encodings reserved.
25:24	PPRF. Read-only. Reset: 2h. Description: 0x0=PPR log dual buffer not supported 0x1=PPR log dual buffer supported without autoswap 0x2=PPR log dual buffer autoswap supported All other encodings reserved.
23:21	GAM_SUP. Read-only. Reset: 1h. General AVIC modes supported.000b=No advanced interrupt features supported (interrupt remapping only).001b=AVIC supported.010b-111b=Reserved.
20:18	SMIF_RC. Read-only. Reset: 2h. Description: Number of SMI filter registers available. 000= 1 SMI filter register 001= 2 SMI filter registers 010= 4 SMI filter registers 011= 8 SMI filter registers 100=16 SMI filter registers All other encodings reserved.
17:16	SMIF_SUP. Read-only. Reset: 1h. Description: SMI filter register supported. Specifies that SMI interrupts may be filtered. 00b = SMI interrupts are always passed through. 01b = SMI interrupts are filtered under the control of [SMIFEN] and the contents of the SMI filter registers. 10b and 11b are reserved values.
15:14	GLX_SUP. Read-only. Reset: 1h.

	Description: 00=single-level guest CR3 base table address translation is support. When GLXSup=00b, the value of GLX in the DTE is ignored and the IOMMU performs only single-level Guest CR3 lookups. 01=Two-level GCR3 base address table is supported in hardware. 10= Three-level GCR3 base address table is supported in hardware for 20-bit PASID values in the future. 11= Reserved. single-level GCR3 base table address translation is supported. When GLX_SUP=0, GLX in the DTE is ignored. The value of GLXSup is not meaningful when GTSup=0
13:12	GATS. Read-only. Reset: 1h. The maximum number of translation levels supported for guest address translation GVA. This value is meaningful when MMIO offset 0030h[GTSup]=0.00b = 4 levels (PML4E), 01b=5 levels, 10b = 6 levels, 11b = Reserved.
11:10	HATS. Read-only. Reset: 2h. Description: The maximum number of host address translation levels supported. This value is not meaningful when GT_SUP=0. 00b=4 levels 01b=5 levels 10b=6 levels 11b=Reserved IOMMU behavior is undefined if Next Level in a page directory entry exceeds the limit set by HATS.
9	PC_SUP. Read-only. Reset: 1. Description: 0=no performance counters are supported. 1=performance counters are supported.
8	HE_SUP. Read-only. Reset: 0. Description: 0=Hardware error registers do not report error information. 1=Error information is reported in hardware error registers.
7	GA_SUP. Read-only. Reset: 1. Description: 1=Guest APIC supported. 0=Guest APIC not supported.
6	IA_SUP. Read-only. Reset: 1. Description: 1=The INVALIDATE_IOMMU_ALL command is supported. 0=The INVALIDATE_IOMMU_ALL command is not supported and will generate an error when used.
5	GAPPI_SUP. Read-only. Reset: 1. Description: 1= Guest APIC Physical Processor Interrupt is supported. 0= Guest APIC Physical Processor Interrupt is not supported.
4	GT_SUP. Read-only. Reset: 1. Description: 1=guest address translation is supported. 0=only nested address translation is supported. When GT_SUP=0, the following values in the DTE must be zero: GV, GLX and GCR3 Table Root Pointer. See also [MMIO Offset 0018h[GT_EN]].
3	NX_SUP. Read-only. Reset: 1. Description: 1=no-execute protection is supported. 0=no-execute protection is not supported.
2	XT_SUP. Read-only. Reset: 1. Description: 1=The interrupt remapping table is expanded to support x2APIC interrupt information. 0=x2APIC support is disabled.
1	PPR_SUP. Read-only. Reset: 1. Description: 1=Indicates that IOMMU handles page service request events from peripherals, the IOMMU supports the page service request queue, and that the second IOMMU interrupt can be used to signal peripheral page service request events. 0=peripheral page service requests are not supported, the page service request queue is not supported and the PPR interrupt is not generated by the IOMMU.
0	PREF_SUP. Read-only. Reset: 0. Description: 1=Indicates that IOMMU accepts PREFETCH_IOMMU_PAGES commands. 0=IOMMU treats PREFETCH_IOMMU_PAGES commands as illegal commands.

IOMMUMMIO[0...3]x00000034 (IOMMUMMIO::IOMMU_MMIO_EFR_1)

Bits	Description
31	SNP_SUP. Read-only. Reset: 1. Description: 0x0=Hardware does not support SNP. 0x1 = Hardware supports SNP.
30	ForcePhyDestSup. Read-only. Reset: 0. 1 = Hardware supports forcing physical destination mode for remapped interrupts
29	V2_HA_DIS_SUP. Read-only. Reset: 1. 1 = Hardware supports disabling v2 Access bit updates by hardware
28:25	VMTABLESIZE. Read-only. Reset: 2h. Description: indicate the size of the VMTable supported. 00h 256 entries 04h 4K entries 08h 64K entries 01h 512 entries 05h 8K entries 09h 128K entries 02h 1K entries 06h 16K entries 0Ah 256K entries 03h 2K entries 07h 32K entries 0Bh 512K entries 0Ch-0Fh: Reserved
24	SVEIO_SUP. Read-only. Reset: 1. Indicates SVE IO support by the hardware.
23	VIOMMU_SUP. Read-only. Reset: 1. 1 = Hardware supports virtualized IOMMU.
22	InvIotlbTypeSup. Read-only. Reset: 1. 1 = Hardware supports invalidate IOTLB type.
21	V2_HD_DIS_SUP. Read-only. Reset: 1. 1 = Hardware supports disabling v2 Dirty bit updates by hardware.
20	HD_SUP. Read-only. Reset: 1. 1 = Hardware supports Host Dirty bit update support for v1 Page tables.
19	ATTRFW_SUP. Read-only. Reset: 1. 1 = Hardware supports forward page table memory attribute to ATC client.
18	EPH_SUP. Read-only. Reset: 1. 1 = Hardware supports Enhanced PPR Handling.
17	HA_SUP. Read-only. Reset: 1. 1 = Hardware supports Host Access bit update support for v1 Page tables.
16	GIO_SUP. Read-only. Reset: 1. 1 = Hardware supports nested I/O protection.
15	SNOOP_ATTRS_SUP. Read-only. Reset: 0. 1 = Hardware supports returning memory attributes of the guest page to ATS requester along with ATS completion.
14	MMIO_MSI_CAP_SUP. Read-only. Reset: 1. 1 = IOMMU advertises that MSI Capability registers are accessible through IOMMU MMIO Space.
13	GMC_IOMMU_BYPASS_SUP. Read-only. Reset: 1. 1 = IOMMU advertises to GMC whether to route memory traffic via Garlic or Onion.
12	BLOCK_STOPMARK_SUP. Read-only. Reset: 1. Description: 0=No blocking Stop Mark Messages supported 1=Block Stop Mark Messages supported.
11:10	MARCnum. Read-only. Reset: 0h. Description: Specifies the number of MARC apertures and thus the number of MARC register 3-tuples supported. 00b = MARC feature not supported, 01b = 4 MARC registers 3-tuples supported, 10b = 8 MARC register 4-tuples are supported, 11b = Reserved
9	PPR_AUTORESP_SUP. Read-only. Reset: 1. 0x1 = Hardware supports ppr auto response generation on log about to be full or generate autoresp on reaching threshold if enabled with OVERFLOW_EARLY.

8	PPR_OVERFLOW_EARLY_SUP. Read-only. Reset: 1. 0x1 = Hardware supports PPR_OVERFLOW_EARLY notification on threshold support.
7:6	DTE_seg. Read-only. Reset: 0h. Description: 0x0 = Hardware supports no DTE segmentation 0x1 = Hardware supports 2-way DTE segmentation 0x2 = Hardware supports 4-way DTE segmentation 0x3 = Hardware supports 8-way DTE segmentation
5	US_SUP. Read-only. Reset: 1. Description: 1=Privileged page protection is supported. 0=Privileged page protection is not supported.
4	Reserved.
3:0	PAS_MAX. Read-only. Reset: Fh. Description: The maximum PASID value supported is calculated as $2^{\text{PAS_MAX}} - 1$. 0h-2h=Reserved 3h=4-bit PASIDs (0-15) 4h=5-bit PASIDs ... Eh=15-bit PASIDs Fh=16-bit PASIDs This value is not meaningful when GT_SUP=0.

IOMMUMMIO[0...3]x00000038 (IOMMUMMIO::IOMMU_MMIO_PPR_BASE_0)

Read-write. Reset: Cold,0000_0000h.

Bits	Description
31:12	DEV_TBL_2_BASE_LO. Read-write. Reset: 0_0000h. Specifies address bits 31:12 of the 4Kbyte-aligned base address of the specific segment of the first level device table.
11:9	Reserved.
8:0	DEV_TBL_2_SIZE. Read-write. Reset: 000h. This field contains 1 less than the length of the device table, in multiples of 4K bytes. A minimum size of 0 corresponds to a 4K byte device table and a maximum size of 1FFh corresponds to a 2M byte device table.

IOMMUMMIO[0...3]x0000010C (IOMMUMMIO::IOMMU_MMIO_DEVTBL_2_BASE_1)

 _iohub1_nbio1_aliasHOST; IOMMUMMIO3x00150; IOMMUMMIO3={IOMMUL2::IOMMU_CAP_BASE_HI_nbio1_aliasHOST[IOMMU_BASE_ADDR_HI], IOMMUL2::IOMMU_CAP_BASE_LO_nbio1_aliasHOST[IOMMU_BASE_ADDR_LO], 19'h0_0000}

Bits	Description
31:27	IOMMU_MSI_NUM_PPR. Read-only. Reset: 00h. This field must indicate which MSI vector is used for the interrupt message generated by the IOMMU for the peripheral page service request log when IOMMUMMIO::IOMMU_MMIO_EFR_0[PPR_SUP] = 1. IOMMU_MSI_NUM_PPR must be 0 when PPR_SUP = 0. For MSI there can be only one IOMMU so this field must be 0. This interrupt is not remapped by the IOMMU.
26:5	Reserved.
4:0	IOMMU_MSI_NUM. Read-only. Reset: 00h. Indicates the MSI vector used for interrupt messages generated by the IOMMU

IOMMUMMIO[0...3]x00000154 (IOMMUMMIO::IOMMU_MMIO_CAP_MISC_1)

Read-only. Reset: 0000_0000h.

_iohub[1:0]_nbio0_aliasSMN; IOMMUMMIO[1:0]x00000154; IOMMUMMIO[1:0]=02[5:4]0_0000h

Bits	Description
31:24	Reserved.
23	MSI_64_EN. Read-only. Reset: Fixed,1. Set to indicate that a 64-bit MSI address is supported.
22:20	MSI_MULT_MESS_EN. Read-write. Reset: Cold,0h. Sets the number of MSI messages assigned to this function.
19:17	MSI_MULT_MESS_CAP. Read-only. Reset: 2h. Indicates the number of MSI messages requested by this function.
16	MSI_EN. Read-write. Reset: Cold,0. Enables MSI for this function and causes legacy interrupts to be disabled.
15:8	MSI_CAP_PTR. Read-only. Reset: Fixed,74h. Pointer to the next configuration space capability.
7:0	MSI_CAP_ID. Read-only. Reset: Fixed,05h. Indicates that this is the MSI capability.

IOMMUMMIO[0...3]x0000015C (IOMMUMMIO::IOMMU_MMIO_MSI_ADDR_LO)

Read-write. Reset: Cold,0000_0000h.

Bits Description

31:19 Reserved.

18:4 **CMD_HDPTR**. Read-write. Reset: 0000h. Specifies the 128-bit aligned offset from the command buffer base address register of the next command to be fetched by the IOMMU. The IOMMU increments this register, rolling over to zero at the end of the buffer, after fetching and validating the command in the command buffer. After incrementing this register, the IOMMU cannot re-fetch the command from the buffer. If this register is written to by software while CmdBufRun=1b, the IOMMU behavior is undefined. If this register is set by software to a value outside the length specified by IOMMUMMIO::IOMMU_MMIO_CMD_BASE_1[COM_LEN], the IOMMU behavior is undefined.

3:0 Reserved.

IOMMUMMIO[0...3]x00002004 (IOMMUMMIO::IOMMU_MMIO_CMD_BUF_HDPTR_1)

Reset: 0000_0000h.

Bits	Description
31:19	Reserved.
18:4	CMD_TAILPTR. Read-write. Reset: 0000h. Specifies the 128-bit aligned offset from the command buffer base address register of the next command to be written by the software. Software must increment this field, rolling over to zero at the end of the buffer, after writing a command to the command buffer. If software advances the tail pointer equal to or beyond the head pointer after adding one or more commands to the buffer, the IOMMU behavior is undefined. If software sets the command buffer tail pointer to an offset beyond the length of the command buffer, the IOMMU behavior is undefined.
3:0	Reserved.

Bits	Description
31:19	Reserved.
18	PPR_OVERFLOW_EARLY. Write-1-to-clear. Reset: Cold,0. 1=IOMMU event log A has reached early overflow threshold. This bit is set when the respected PPR log has reached the programmable threshold and when Overflow_early_en=1. When Auto_resp_en=1, hardware generates auto responses for the last PPR request and let Stop marker PPR msg through the log.
17	PPR_B_OVERFLOW_EARLY. Write-1-to-clear. Reset: Cold,0. 1=IOMMU event log B has reached early overflow threshold. This bit is set when the respected PPR log has reached the programmable threshold and when Overflow_early_en=1. When Auto_resp_en=1, hardware will generates auto responses for the last PPR request and let Stop marker PPR msg through the log.
16	EVENT_BUF_ACTIVE. Read-only. Reset: 0. 0=EVENT default Buf being used by hardware, 1=EVENT Buf B being used by hardware.
15	EVENT_B_OVERFLOW. Write-1-to-clear. Reset: Cold,0. Description: 1=IOMMU event log B overflow has occurred. This bit is set when a new event is to be written to the event log and there is no usable entry in the event log, causing the new event information to be discarded. An interrupt is generated when EventOverflow=1b and IOMMUMMIO::IOMMU_MMIO_CNTRL_0[EVENT_INT_EN]=1b. No new event log entries are written while this bit is set.
14:13	Reserved.
12	PPR_BUF_ACTIVE. Read-only. Reset: 0. 0=PPR default Buf being used by hardware, 1=PPR Buf B being used by hardware.
11	PPR_B_OVERFLOW. Write-1-to-clear. Reset: Cold,0. Description: 1=IOMMU PPR log B overflow has occurred. This bit is set when a new peripheral page service request is to be written to the PPR log and there is no usable entry in the PPR log, causing the new information to be discarded. 0=There is no IOMMU PPR log overflow. An interrupt is generated when PPR_OVERFLOW=1b and [MMIO Offset 0018h[PPR_INT_EN]]=1b. No new PPR log entries are written while this bit is set.
10	GA_INT. Write-1-to-clear. Reset: Cold,0. Description: 1=GA request entry written to the GA log by the IOMMU. 0=No GA entry written to the GA log by the IOMMU. An interrupt is generated when GA_INT=1b and [MMIO Offset 0018h[GA_INT_EN]]=1b.
9	GA_OVERFLOW. Write-1-to-clear. Reset: Cold,0. Description: 1=IOMMU GA log overflow has occurred. This bit is set when a new peripheral page service request is to be written to the GA log and there is no usable entry in the GA log, causing the new information to be discarded. 0=There is no IOMMU GA log overflow. An interrupt is generated when GA_OVERFLOW=1b and [MMIO Offset 0018h[GA_INT_EN]]=1b. No new GA log entries are written while this bit is set.
8	GA_RUN. Read-only. Reset: 0.

	Description: 1=GA requests are logged as they occur. 0=GA requests are discarded without logging. When GA_OVERFLOW=1b, the IOMMU does not write new GA log entries even when GA_RUN=1b. When halted, GA request logging is restarted by using IOMMUMMIO::IOMMU_MMIO_CNTRL_0[GA_LOG_EN].
7	PPR_RUN. Read-only. Reset: 0. Description: 1=PPR requests are logged as they occur. 0=PPR requests are discarded without logging. When PPR_OVERFLOW=1b, the IOMMU does not write new PPR log entries even when PPR_RUN=1b. When halted, PPR request logging is restarted by using IOMMUMMIO::IOMMU_MMIO_CNTRL_0[PPR_LOG_EN].
6	PPR_INT. Write-1-to-clear. Reset: Cold,0. Description: 1=PPR request entry written to the PPR log by the IOMMU. 0=No PPR entry written to the PPR log by the IOMMU. An interrupt is generated when PPR_INT=1b and IOMMUMMIO::IOMMU_MMIO_CNTRL_0[PPR_INT_EN]=1b.
5	PPR_OVERFLOW. Write-1-to-clear. Reset: Cold,0. Description: 1=IOMMU PPR log overflow has occurred. This bit is set when a new peripheral page service request is to be written to the PPR log and there is no usable entry in the PPR log, causing the new information to be discarded. 0=There is no IOMMU PPR log overflow. An interrupt is generated when PPR_OVERFLOW=1b and [MMIO Offset 0018h[PPR_INT_EN]]=1b. No new PPR log entries are written while this bit is set.
4	CMD_BUFRUN. Read-only. Reset: 0. Description: 1=commands may be fetched from the command buffer. 0=IOMMU has stopped fetching new commands. The IOMMU freezes command processing after COMMAND_HARDWARE_ERROR or ILLEGAL_COMMAND_ERROR errors. When frozen, command fetching is restarted by using IOMMUMMIO::IOMMU_MMIO_CNTRL_0[CMD_BUF_EN].
3	EVENT_LOGRUN. Read-only. Reset: 0. Description: 1=events are logged as they occur. 0=event reports are discarded without logging. When EventOverflow=1b, the IOMMU does not write new event log entries even when EventLogRun=1b. When halted, event logging is restarted by using MMIO Offset 0018h[EventLogEn].
2	COMWAIT_INT. Write-1-to-clear. Reset: Cold,0. Description: 1=COMPLETION_WAIT command completed. This bit is only set if the i bit is set in the COMPLETION_WAIT command. An interrupt is generated when ComWaitInt=1b and MMIO Offset 0018h[ComWaitIntEn]=1b.
1	EVENT_LOGINT. Write-1-to-clear. Reset: Cold,0. Description: 1=Event entry written to the event log by the IOMMU. 0=No event entry written to the event log by the IOMMU. An interrupt is generated when EventLogInt=1b and IOMMUMMIO::IOMMU_MMIO_CNTRL_0[EVENT_INT_EN]=1b.
0	EVENT_OVERFLOW. Write-1-to-clear. Reset: Cold,0. Description: 1=IOMMU event log overflow has occurred. This bit is set when a new event is to be written to the event log and there is no usable entry in the event log, causing the new event information to be discarded. An interrupt is generated when EventOverflow=1b and IOMMUMMIO::IOMMU_MMIO_CNTRL_0[EVENT_INT_EN]=1b. No new event log entries are written while this bit is set.

Bits Description

31:19 Reserved.

18:4 **PPR_HDPTR.** Read-write. Reset: 0000h. Specifies the 128-bit aligned offset from the PPR log base address register that is read next by software. Software must increment this field, rolling over at the end of the buffer, after reading a PPR request entry from the PPR event log. If software advances the head pointer beyond the tail pointer, the IOMMU behavior is undefined. If software sets the PPR log head pointer to an offset beyond the length of the PPR log, the IOMMU behavior is undefined.

3:0 Reserved.

Bits	Description
31:19	Reserved.
18:4	EVENT_B_HDPTR. Read-write. Reset: 0000h. Specifies the 128 bit aligned offset from the event log B base address register that is read next by software. Software must increment this field, rolling over at the end of the buffer, after reading an event from the event log. If software advances the head pointer beyond the tail pointer, the IOMMU behavior is undefined. If software sets the event log head pointer to an offset beyond the length of the event log, the IOMMU behavior is undefined.
3:0	Reserved.

Bits	Description
31	CERE_1_1. Read-write. Reset: 0. Description: Counter Event Report Enable. 0=no event report when counter wraps to zero. 1=IOMMU writes an EVENT_COUNTER_ZERO event log entry when the counter wraps to zero. The counter-wrap event is treated like any other event. Software note: the counter-wrap event is delivered promptly but there is no defined latency expectation.
30:20	Reserved.
19:0	EVENT_NOTE_1_1_HI. Read-write. Reset: 0_0000h. Event Note (bits 51:32). When CERE=1 and the corresponding counter is incremented and wraps to zero, EVENT_NOTE[51:0] is reported in the EVENT_COUNTER_ZERO event log entry.

IOMMUMMIO[0...3]x00041200 (IOMMUMMIO::IOMMU_MMIO_COUNTER_BANK_1_CNT_2_0)

19:0	EVENT_NOTE_1_3_HI. Read-write. Reset: 0_0000h. Event Note (bits 51:32). When CERE=1 and the corresponding counter is incremented and wraps to zero, EVENT_NOTE[51:0] is reported in the EVENT_COUNTER_ZERO event log entry.

13.6 Non-Transparent Bridge

The [PCIe](#) non-transparent bridge (NTB) feature is only supported by processor orderable part numbers (OPN) targeted for the embedded market segment.

13.6.1 Definitions

Table 234: Link Definitions

Term	Description
NTB	Non-transparent bridge. A device that links the memory space of two separate systems together. The processor implements a NTB that connects two systems together using the PCIe interface.

13.6.2 Architecture

The processor contains a single [PCIe](#) non-transparent bridge (NTB) device per node. A non-transparent bridge may be used to link two systems together using a PCIe interface. Conceptually, the NTB looks like a PCIe device with two endpoint interfaces and allows memory requests to cross between the two interfaces with translation logic used to keep the two system address spaces separate.

From a functional standpoint, the NTB device itself is symmetric in nature but the connection paths to the endpoints are asymmetric. The primary side of the NTB connects to one of the processor's internal root-complex ports. This side sends DMA traffic to local system memory and receives [MMIO](#) and peer-to-peer traffic from the local system.

The secondary side of the NTB is tied to a physical PCIe interface and connects to an external system. Port A of either PCIe controller on the same node may be programmed to change from a normal root-complex port to a switch upstream port. The switch upstream port supports up to x16 width. Additional internal logic exposes a switch downstream port and the secondary side NTB endpoint configuration space behind the externally facing switch upstream port.

13.6.2.1 NTB BAR Layout

Each side of the NTB appears as a [PCIe](#) endpoint device. Each endpoint exposes 4 BARs. BAR0 contains control registers. MSI-X interrupt controls are located inside BAR0. The MSI-X table starts at BAR0+8K while the MSI-X pending bit array table starts at BAR0+12K.

BAR1 is used to store look-up-table translation entries for LUT translation mode. BAR23 and BAR45 are 64-bit BARs used to pass requests to the opposite side of the NTB.

13.6.2.2 NTB BAR Sizing

The NTB supports the [PCIe](#)-defined resizable [BAR](#) capability to configure the BAR size. BAR23 and BAR45 each support sizes up to 2PB. An initial BAR size may be set by SBIOS before PCI enumeration using the procedure described below. An OS which supports resizable BAR may subsequently choose to resize the BAR based on OS-specific criteria.

Each side of the NTB may be configured separately. The controls to expose the resizable BAR capability are located in nBIF0 for the primary side NTB endpoint function and nBIF2 for the secondary side NTB endpoint function.

Once the resizable BAR capability is exposed, the BAR size may then be set using the following registers:

```
NBIFEPFNCFG::PCIE_BAR2_CNTL[BAR_SIZE]
NBIFEPFNCFG::PCIE_BAR3_CNTL[BAR_SIZE]
```

13.6.2.3 NTB Initialization

The following table describes the programming instructions needed to configure the node to connect the NTB to one of the [PCIe](#) ports or to disconnect the NTB. Additional programming is needed to configure the PCIe controller between the root complex mode and the switch mode needed for NTB.

13.6.2.4 Back-to-Back Initialization

In some usage models, two identical systems may be connected together using the NTB either through a backplane connection or a cable. The processor does not support data transfers when the [PCIe](#) link is trained in a cross-link configuration (ie. 2 downstream ports connected together or 2 upstream ports connected together). This can occur if both systems expose a normal root port to the connecting link, or both systems expose a switch upstream port behind the NTB to the connecting link.

Systems may use jumpers or switches to configure one of the systems to enable its NTB while the other system disables its NTB and exposes a normal root port. If such indicators are not available, more complex dynamic negotiation is possible to create a connection that avoids a cross-link condition. During link training, each system must check for a possible cross-link condition. If one is detected, each side may randomly change the system between 2 possible NTB configurations, and then retrain the link. This process must be repeated until the cross-link condition is eliminated.

The table below summarizes the 2 NTB configurations that the system may be configured as to resolve the cross-link condition. In both cases, the internal path to primary side of the NTB is active, so both systems see a local NTB. Only configuration B connects the secondary side of the NTB to a physical PCIe interface. This creates 2 logical NTB paths to connect the systems together but only one of the paths is active at any one time.

Table 235: NTB System Configurations to avoid Cross-Link

NTB Configuration A	NTB Configuration B
PCIe Port A is configured as a root port	PCIe Port A is configured as a switch upstream port
NTB secondary side is disconnected from PCIe	NTB secondary side is connected to PCIe port A
PCIe Port H is hidden	PCIe Port H is exposed and remapped to the bus/device/function used by PCIe Port A when it is used as a root port in configuration A. This port is disconnected from the PHY and cannot train.
Signal OS-level software using standard PCIe RC hot-plug mechanisms to connect or disconnect the external NTB.	No OS-visible hot-plug. MP1 firmware signals both the primary and secondary side NTB drivers of link up/down conditions using the FW<->Driver mailbox mechanism.

Figure 53: Processor NTB Configurations

13.6.2.4.1 Back-to-Back Hot-Add

The use of NTB configurations A and B is designed to facilitate hot-plug support for the [PCIe](#) link connecting the 2 systems together. When in configuration A, PCIe port A reports hot-add using the standard OS-visible PCIe hot-plug facilities. When in configuration B, [MP1](#) firmware managing the link training process reports link-up to both the primary and secondary side NTB drivers using the NTB to firmware mailbox.

After successful link training, the system in configuration A operates as if a new device has been connected to its root port. This should look like a normal PCIe root port hot-add. The OS on the configuration A system should load the NTB driver for the external secondary side NTB. The system in configuration B does not see a PCIe hot-add event because the connected NTB was already connected on the primary side to its internal root port. It does not see a change in PCI topology.

13.6.2.4.2 Back-to-Back Hot-Remove

In a hot-remove scenario, the [MP1](#) firmware is responsible for placing the [PCIe](#) interface into a low power state and preparing for a future hot-add. The system in configuration A sees the external NTB connected to its root port undergo a standard PCIe hot-remove operation. The NTB driver running on this system is unloaded. The MP1 firmware running on the system in configuration B signals link-down to the local NTB primary side driver.

13.6.2.4.3 Link-Up/Link-Down Signaling to Driver

Link-Up is signaled to the primary side driver via NTB::PINTSTA[PMISC0_INTSTA][0]. Similarly, link-down is signaled to the primary side driver via NTB::PINTSTA[PMISC0_INTSTA][1]. These generate an interrupt to the primary side driver if interrupts for the corresponding event are not masked.

Link-Up is signaled to the secondary side driver via NTB::SINTSTA[SMISC0_INTSTA][0]. Similarly, link-down is signaled to the primary side driver via NTB::SINTSTA[SMISC0_INTSTA][1]. These generate an interrupt to the secondary side driver if interrupts for the corresponding event are not masked.

The secondary side driver does not see link-down on a hot-remove event. The OS should signal the driver to unload when the NTB is removed from the system.

13.6.2.5 vNTB

vNTB allows looping back downstream VC0/VC1 reads/writes into upstream VC6. This feature could be used for some use case like PIO mode for lower latency signaling between Hypervisor and Storage VM.

The [PCIe](#) ordering shall be maintained by software in vNTB mode. Hardware provides the Flush operation to assist the software for the ordering and software could program the Flush registers to trigger it.

SBIOS should program the register fields below to enable this feature.

```
NTB::NTB_SMU_VMODE[NTB_SMU_VMODEEN] =0x1
NTB::PFLUSH_MOD[PFLUSH_MOD] =0x1
NTB::SFLUSH_MOD[SFLUSH_MOD] =0x1
NTB::NTB_SMU_SDPPTEN =0x3
```

13.6.2.6 VCO Write

vNTB supports downstream SDP VC0 writes and loop these back into upper VC0.

SBIOS should program the register field below to enable this feature.

```
NTB::NTB_SMU_VC0WREN[VC0WREN_VMOD] =0x1
```

13.6.3 NTB Registers

Bits	Description
31	PSMU_SPADMUTEXCLEAR. Write-only. Reset: 0. 1 = clear the entire 32-bit register to 0.
30:0	PSMU_SPADMUTEXID. Read-write. Reset: 0000_0000h. 0 = the mutex is free. When it's not zero, the mutex is owned by the master which ID is the value of this register field.

NBIO0NTB0x000004B4...NBIO1NTB1x000004C0 (NTB::PSMU_SPADREG)

Read-write. Reset: 0000_0000h.

`_instNTB0_n[3:0]_nbio0_aliasSMN; NBIO0NTB0x0000_04[C0,BC,B8,B4]; NBIO0NTB0=0400_0000h``_instNTB1_n[3:0]_nbio0_aliasSMN; NBIO0NTB1x0000_04[C0,BC,B8,B4]; NBIO0NTB1=0410_0000h``_instNTB0_n[3:0]_nbio1_aliasSMN; NBIO1NTB0x0000_04[C0,BC,B8,B4]; NBIO1NTB0=0420_0000h``_instNTB1_n[3:0]_nbio1_aliasSMN; NBIO1NTB1x0000_04[C0,BC,B8,B4]; NBIO1NTB1=0430_0000h`

Bits	Description
31:0	PSMU_SPADREG. Read-write. Reset: 0000_0000h. Description: This is one of the Primary-SMU scratch pad registers. Synchronization is provided with a hardware semaphore (PSMU_SPADMUTEX). There are 4 indexes (0 ~ 3), index number corresponds to "_n*" in register_instance. For example: <code>_instNTB0_n3_nbio0_aliasSMN, _instNTB0_n3_nbio1_aliasSMN, _instNTB1_n3_nbio0_aliasSMN</code> and <code>_instNTB1_n3_nbio1_aliasSMN</code> means "This is one of the Primary-SMU scratch pad registers which index is 3"

NBIO0NTB0x000004F0...NBIO1NTB1x000004F0 (NTB::PLUT_CTRL)`_inst[NTB[1:0]]_nbio0_aliasSMN; NBIO0NTB[1:0]x000004F0; NBIO0NTB[1:0]=04[1:0]0_0000h``_inst[NTB[1:0]]_nbio1_aliasSMN; NBIO1NTB[1:0]x000004F0; NBIO1NTB[1:0]=04[3:2]0_0000h`

Bits	Description
31:16	Reserved.
15:8	PLUT_SIZEUNIT. Read-write. Reset: 00h. The translated granularity of the look-up-table translation window on the primary side. The granularity is a value of power-of-2 sizes starting from 4KB, it can be calculated by $4KB * (2^{PLUT_SIZEUNIT})$. 0 = 4KB; 1 = 8KB; 2 = 16KB; 3 = 32KB; 4 = 64KB; 5 = 128KB; Software should take the responsibility to program a correct value.
7:2	Reserved.
1	PLUT_ALLOC. Read-write. Reset: 0. Description: When the look-up-table resource on the primary side is enable, this field allocates the entire look-up-table resource on the primary side to one of the BARs (BAR1, BAR2/3, BAR4/5) on the primary side, all the other BARs on the primary side use the direct address translations. 0 = It is allocated for PBAR2/3. 1 = It is allocated for PBAR4/5.
0	PLUT_EN. Read-write. Reset: 0. Description: 1 = Enable the look-up-table resource on the primary side. It can be used for one of the BARs (BAR1, BAR2/3 and BAR4/5) on the primary side. 0 = Disable the look-up-table resource on the primary side.

NBIO0NTB0x000004F4...NBIO1NTB1x000004F4 (NTB::PLUT_TOTAL_ENTRY)

Read-only. Reset: Fixed,0000_000Bh.

_inst[NTB[1:0]]_nbio0_aliasSMN; NBIO0NTB[1:0]x000004F4; NBIO0NTB[1:0]=04[1:0]0_0000h

_inst[NTB[1:0]]_nbio1_aliasSMN; NBIO1NTB[1:0]x000004F4; NBIO1NTB[1:0]=04[3:2]0_0000h

Bits	Description
31:4	Reserved.
3:0	PLUT_TOTAL_ENTRY . Read-only. Reset: Fixed,Bh. This field records the total number of the Lookup table entries provide by Hardware on the primary side system, it can be calculated by $2^{(PLUT_TOTAL_ENTRY+1)}$. The value is implementation specific for projects.

NBIO0NTB0x000004F8...NBIO1NTB1x000004F8 (NTB::PLUT_STRIDE)

_inst[NTB[1:0]]_nbio0_aliasSMN; NBIO0NTB[1:0]x000004F8; NBIO0NTB[1:0]=04[1:0]0_0000h

_inst[NTB[1:0]]_nbio1_aliasSMN; NBIO1NTB[1:0]x000004F8; NBIO1NTB[1:0]=04[3:2]0_0000h

Bits	Description
31:8	Reserved.
7:0	PLUT_STRIDE . Read-write. Reset: 00h. Each LUT entry is 128-bits in size. This register indicates the stride between PLUT entries. The stride is a value of power-of-2 sizes starting from 4KB, is specified as $4KB \cdot (2^{PLUT_STRIDE})$. A value of 0h indicates a stride of 4K bytes, where the LUT entries are spaced 4k apart in PBAR1.

NBIO0NTB0x000004FC...NBIO1NTB1x000004FC (NTB::PLUT_ECC_ERRCNT)

_inst[NTB[1:0]]_nbio0_aliasSMN; NBIO0NTB[1:0]x000004FC; NBIO0NTB[1:0]=04[1:0]0_0000h

_inst[NTB[1:0]]_nbio1_aliasSMN; NBIO1NTB[1:0]x000004FC; NBIO1NTB[1:0]=04[3:2]0_0000h

Bits	Description
31:21	Reserved.
20	NTB_PLUT_ECCDEI_WAY . Read-write. Reset: 0. Description: This bit is only useful when NTB_PLUT_ECCDEI_EN is one and it is used to configure the way to inject double error. 1: inject error during writing to memory 0: inject error during reading from memory
19	NTB_PLUT_ECC_ERREVT_EN . Read-write. Reset: 0. Primary side lookup table ECC ERREVENT enable
18	NTB_PLUT_ECCDEI_EN . Read-write. Reset: 0. Primary side lookup table ECC double error injection enable. HW will inject one double error on each write 1'b1 to this bit. Please notice that NTB_PRI_LUT_ECCSEI_EN and NTB_PRI_LUT_ECCDEI_EN should be one hot, cannot be written to 1'b1 at the same time.
17	NTB_PLUT_ECCSEI_EN . Read-write. Reset: 0. Primary side lookup table ECC single error injection enable. HW will inject one single error on each write 1'b1 to this bit. Please notice that NTB_PRI_LUT_ECCSEI_EN and NTB_PRI_LUT_ECCDEI_EN should be one hot, cannot be written to 1'b1 at the same time.
16	PLUT_ECCERR_DROP_EN . Read-write. Reset: 0. Description: 1 = stop all the transactions from primary side when detect primary SDP parity error. Stop all the transactions from secondary side when detect secondary SDP parity error. 0 = continue transactions and only discard the error command.
15:8	PLUT_ECC_DECNT . Read-write. Reset: 01h. This field records the Lookup table ECC double error occur times provide by Hardware on the primary side system.
7:0	PLUT_ECC_SECNT . Read-write. Reset: 01h. This field records the Lookup table ECC single error occur times provide by Hardware on the primary side system.

13.7 PCIe®

13.7.1 Definitions

Table 236: Link Definitions

Term	Description
Link	Generic term that refers to a refer to PCIe link.
Master abort	This is a PCI-defined term that is applied to transactions on other than PCI buses. It indicates that the transaction is terminated without affecting the intended target; reads return all 1's; writes are discarded; the master abort error code is returned in the response, if applicable; master abort error bits are set if applicable.
PRBS	Pseudo-random bit sequence.
RC	Root Complex.
CXL™	Compute Express Link™, see https://www.computeexpresslink.org

13.7.2 Introduction

In order to support a wide variety of system topologies, the PCI Express ([PCIe](#)) subsystem is highly configurable. The PCIe cores have been designed for, and incorporated into the PCIe root complex fabric in a manner that ensures that system BIOS has the opportunity and flexibility to configure the PCIe capabilities to the required system topology. Once the PCIe subsystem has been configured to reflect the requirements and functionality of the system topology, the individual PCIe links are allowed to train and establish connections to PCIe devices present in the system. Once the links have been trained, system BIOS may pass control to the operating system or it may complete other tasks unrelated to PCIe.

13.7.3 Register Access

13.7.3.1 PCIe® IP Register Space

Software programmable registers are accessed through [SMN](#) from remote SMU(RSMU). The upper-part of SMN address are known as Aperture ID used for routing the SMN packet to the correct IP. The RSMU inside the IP tile outputs a 20-bit lower-part SMN address for addressing registers of the IP. The upper 16 bits are also available on the Aperture ID port of the RSMU but are not expected to be used. This means that each RSMU/IP is allocated a 1MB space. The SMN address decoder is responsible for decoding this 20-bit address. In [PCIe](#) IP, there are three register spaces available:

1. Per Port Configuration Space
 - From the CPU's perspective, this is a direct access. The CPU issues the transaction through its normal data path to IOHUB/nBIF. The IOHUB/nBIF detects that this is a configuration cycle and generates an SMN transaction on the SMN network, constructing the 20-bit address.
 - In the case where some other party needs to access the port's configuration space (for example the SMU) it becomes the initiator of the SMN transaction, creating the 20-bit address and targets the correct IP with the aperture ID (upper 16 bits).
2. Per Port Private Space
 - From CPU's perspective, this is an indirect access. In each port's configuration space there is an aperture defined by the PCIe specification to access that ports private space. The CPU issues the transaction through the normal data path to the IOHUB/nBIF with an indirect address based on the associated aperture. The IOHUB/nBIF is the entry point for the SMN and generates the SMN packet to the correct IP with the correct 20-bit address.

- In the case where software needs to access the port's private space (for example the SMU), it becomes the initiator of the SMN transaction, creating the 20-bit address, and targets the correct IP.
3. Per Core Private Space – Indirect Access
- It is not expected that third party software requires this space. Only the SBIOS and driver software are expected to use the registers in this space.
 - The software accesses this address space by using an aperture in:
 1. Root Complex: the IOHUB's configuration space (Index/Data pair in nbconfig space).
 2. Switch: nBIF's memory mapped space.
 3. It is the responsibility of these two parties to intercept this transaction, decode it, and initiate the SMN transaction. It needs to target the correct IP space and generate the correct 20 bit address.
 - In the case where software needs to access the PCIe core space (for example the SMU), it becomes the initiator of the SMN transaction, creating the 20-bit address, and targets the correct IP.

From the system point of view, the PCIe IP space (20-Bit, 1MB) is shown below (in blue shaded area) and it can be accessed by the 2 paths:

Figure 54: Northbridge Memory Map From the SDF Point of View

13.7.3.1.1 Sub-division of the allocated PCIe® Space

The RSMU outputs a 20-bit address bus. This 1 MB space is further divided into the multiple PCIe spaces as shown in the diagram below. Note that there is 1 RSMU per PCIe core. The routing of the SMN packet over the SMN network using the aperture ID (bits[36:20]) is beyond the scope of this section.

New address Map (SMN)

19	18	17-12	11 - 0	
0 – Function	0 – Cfg access	Function #	register address	Port Configuration space
0 - Function	1 – Private access	Function #	register address	Port Private Space
1 - Core	Unused	register address		Core (PCIe IP) Space

Figure 55: Allocated PCIe® space on the SMN

Bit[19] in the above figure allows the user to specify if the register access is a port register access or a core (PCIe IP) access.

Port Access:

Bit[18] only has meaning if bit[19] == 0 (port access) and specifies if the register access is targeting the ports configuration space or the ports private space. Bits[17:12] provide the port number. This field allows software to access different ports (ports start from 0). Bits[11:0] are the actual register addresses defined in the port's configuration or private space.

Core (PCIe) access:

If bit[19] == 1, then software is accessing the PCIe registers. In this case, bit[18] is always 0. Bits[17:0] specify the PCIe IP space register address.

New address Map (SMN)

19	18	17-12	11 - 0
0 – Function	0 – Cfg access	Function #	register address
0 - Function	1 – Private access	Function #	register address
1 - Core	Unused	register address	

Figure 56: Generic PCIe® Address Map for 2 PCIe® blocks

The previous figure shows the usage of the allocated 20 bits of address space inside the PCIe. This diagram shows two PCIe blocks. The Green PCIe block has two ports; the blue block has 5 ports.

13.7.3.2 Example for accessing a PCIe® Core register

Here is an example that shows how a common [PCIe](#) status register can be read using an [SMN](#) address:

PCIe SWRESET COMMAND AND STATUS REGISTER

Figure 57: Common PCIe® Status Register

The SMN register address is constructed as the following:

Register Address bits[31:20] = PCIe IP's Apperture ID on the SMN network.

Register Address bits[19:12] = 8'b10000000 (8'h80 PCIe Core Space)

Register Address bits[11:0] = Register Offset

13.7.4 PCIe® Programming

13.7.4.1 SMU initialization

The SMU is responsible for the following actions before handing over control the software:

1. De-assert Cold Reset.
2. Program security fencing registers.
3. Program start and end addresses for fuse fetch and initiate the RSMU fuse fetch process.
4. Poll to see if the fuse fetch process is complete.
5. De-assert Hard Reset.

13.7.4.2 Pre-Link BIOS Initialization

1. After the SMU has handed over control to the SBIOS, the initialization process can commence. The first step the SBIOS should take is to check if the reset process has been completed successfully. This can be done by checking if the RESET_COMPLETE bit is set to 1 in the register SWRST_COMMAND_STATUS.
2. The second step in the SBIOS initialization sequence must be to program the Straps using the RSMU Index/Data pair method described above. This is where the topology settings, link configuration, selecting [PCIe](#) Port 0's mode (configure as Down Stream Port or Switch Upstream Port) and other aspects of the PCIe IP can be programmed.
3. To make the strap changes take effect inside the PCIe IP, the reconfigure process must be used. The reconfigure process puts the PCIe Core logic into reset and then allows the updated Strap values to be propagated into the PCIe IP. Finally, the reconfigure process brings the PCIe Core logic out of reset.
4. The final step for the SBIOS is to release hold training (Set register bits HOLD_TRAINING_<PORT> to 0) for all the ports which need to function.

13.7.4.3 Architecture and Configuration Topology

13.7.4.3.1 Configuration Topology

The [PCIe](#) fabric implements multiple PCI Express point-to-point links, of varying widths, to external PCIe devices. In total, the processor supports multiple PCIe "engines" that control all available PCIe lanes.

For example, PCIe RC9x16 controller core controls a total of 16 PCIe lanes using 9 engines to control links of one or more lanes as follows Note: The nomenclature used here reflects the number of lanes assigned to each of the engines, listed as e0:e1:e2:e3:e4:

Table 237: Example of PCIe® Link Configurations

Core	PCIe Configuration		Symbol(STRAP_BIF_LINK_CONFIG value)
RC9x16	16		A(000000)
	8:8		F(000101)
	8:4:4		G(000110)
	8:4:2:2		H(000111)
	8:4:2:1:1		I(001000)
	8:4:1:1:1:1		J(001001)
	8:2:2:2:2		K(001010)
	8:2:2:2:1:1		L(001011)
	8:2:2:1:1:1:1		M(001100)
	8:2:1:1:1:1:1:1		N(001101)
	8:1:1:1:1:1:1:1:1		O(001110)
	4:4:4:4		P(001111)
	4:4:4:2:2		Q(010000)
	4:4:4:2:1:1		R(010001)

	2:2:2:2:2:2:2:2		F1(011110)
	2:2:2:2:2:2:1:1		G1(011111)

The PCIe Root Complex (RC) design implements a Root Complex Type 1 Configuration Header for each PCIe engine / link.

13.7.4.3.2 Port Re-ordering

13.7.4.3.2.1 Motivation for Additional Configurations and Routing Support

The evolution of [PCIe](#) protocol have enabled architectures that define a greater number of PCIe links than were supported on past products with the same number of dedicated PCIe pins while maintaining or exceeding the performance of existing products. This is accomplished by reducing the number of lanes per link but running the link at higher data rates. In order to facilitate the change, without increasing the number of PCIe cores that are deployed, additional PCIe configurations have been defined within this document. The implementation of the PCIe supports up to 16 PCIe lanes and up to 16 PCI Express links. In addition to the expanded configuration support, a more flexible logical to physical lane routing strategy is implemented. Heretofore, the sole criterion used when the PCIe IP assigns its logical lanes to the physical lanes was the default link width. The link with the widest width was pegged to physical lane 0. The link with the next widest width would be physical lane 1, and so on. This limited the flexibility of the board level connections and it occasionally caused supplementary routing requirements at the SoC level or at the board level. To alleviate the additional routing, PCIe controller allows the order in which logical lanes of each port are assigned to physical lanes to be defined through port ordering registers (i.e., by software).

13.7.4.3.2.2 Port Re-Ordering Definition and Rules

The port re-ordering feature allows the end user to define the port order, through strap-loadable registers, at the same time or after defining the configuration and prior to taking the IP out of reset.

When programming the new PHYSICAL_LANE_MAP registers, all the following rules must be followed:

- LINK_CONFIG will set the maximum width for every port in the architecture.
- For each active port in the LINK_CONFIG:
 - The number of physical lanes assigned to the port must be exactly equal to the width of the port in the LINK_CONFIG.
 - If the width of the port is <M>, then each logical lane from "0" to "<M>-1" must be assigned exactly once for that port.
 - E.g. If a port is x4, then logical lanes 0/1/2/3 must be assigned to a physical lane each. Assigning one of those logical lanes for that port to multiple physical lanes is illegal, as is omitting an assignment for one of those logical lanes. Assigning a logical lane of 4 (or higher) for that port is also illegal.
 - All logical lanes must be assigned on adjacent physical lanes.
 - The logical lanes can only be assigned in ascending order (non-reversed link) or descending order (reversed link). A scrambled lane order is illegal.
 - If the port is width <M>, the first Physical Lane assigned must be a multiple of <M>.
 - The first assigned lane is Logical Lane "0" if the port is not reversed, or Logical Lane "<M>-1" if the port is reversed.
 - E.g. If a port is x2, the first assigned lane must be lane 0/2/4/..., but cannot be lane 1/3/5/...
- If a port is not active in the selected LINK_CONFIG, that port must not be assigned to any physical lanes.
- Each physical lane present in the architecture must be assigned to an active port and a valid logical lane within that port.

13.7.4.3.3 Lane Aggregation

This section depicts the physical pin to logical lane ID mapping as well as the possible ways in which the lanes may be aggregated into links.

There are eight [PCIe](#) controllers in the design, which are of RC9x16 design configuration. And there is another PCIe controller which is of RC4x4 design configuration. PCIe RC9x16 controller supports as many as 9 ports and as many as 16 lanes. The ports combination can be 2:2:2:2:2:2:2, 1:1:2:2:2:2:4, 2:2:2:2:2:4, 4:4:4:4, 8:8, 16 and etc. Port reordering is supported to utilize the physical lanes which may be laid out differently compared with the logical lane layout. Other port combinations might be supported, in case the follow design rules are adhered to.

- port number not exceeds max-port-number
- port width is valid for each port
- port reorder rules are complied with

The SERDES PHYs are shared by multiple protocols including XGMI, PCIe/CXL™, SATA. PHYs and Controllers are separated into a left half and a right half, which is used to accommodate the board-level layout. The PHY lane aggregation of left half of the design is shown in Figure 58 [PCIe® lane aggregation map left half].

Figure 58: PCIe® lane aggregation map left half

The PHY lane aggregation of right half of the design is shown in Figure 59 [PCIe® lane aggregation map right half].

Figure 59: PCIe® lane aggregation map right half

Please refer to [DXIO](#) section of "Supported PHY Sharing Configuration" for more information on sharing PHY lanes with multiple controllers.

When the PCIe RC9x16 controller is configured into multiple PCIe ports instead of a single x16 PCIe port, the configured PCIe ports can be classified into a left subset connecting with 8 PHY lanes and a right subset connecting with the other 8 PHY lanes. PCIe configurations supported by a subset (either the left subset or the right subset) are listed in Table 238 [Half-sized PCIe® RC9x16 lane configurations]. The lane configuration chosen for the left and right subsets could be different, but the total ports configured for the PCIe controller should not exceed 9 for the PCIe RC9x16 controller. In general the PCIe RC9x16 controller supports a PCIe configuration with below constraints,

- fully occupy the 16 lanes
- port with is x1, x2, x4, x8, or x16
- all x2 ports start from even lane
- all x4 ports start from lane 0, 4, 8, or 12
- all x8 ports start from lane 0, or 8
- no more than 9 ports

Table 238: Half-sized PCIe® RC9x16 lane configurations

Physical/Logical Lanes		0	1	2	3	4	5	6	7

Bits	Description
31	LINK_RESET_TYPE_LINK_DOWN. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the link reset event was caused by a link down. Clearing the link reset request status bit (SWUS_LINK_RESET, SWUS_LINK_RESET_CFG_ONLY, or SWUS_LINK_RESET_PHY_CALIB) clears this bit.
30	LINK_RESET_TYPE_LINK_DISABLE. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the link reset event was caused by a link disable. Clearing the link reset request status bit (SWUS_LINK_RESET, SWUS_LINK_RESET_CFG_ONLY, or SWUS_LINK_RESET_PHY_CALIB) clears this bit.
29	LINK_RESET_TYPE_HOT_RESET. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the link reset event was caused by a hot reset. Clearing the link reset request status bit (SWUS_LINK_RESET, SWUS_LINK_RESET_CFG_ONLY, or SWUS_LINK_RESET_PHY_CALIB) clears this bit.
28	SWDS_LINK_RESET_CFG_ONLY. Read-write. Reset: 0. 0=Not Detected. 1=Detected. (Switch Downstream only) Indicates if there is a request to perform a link reset (hot reset, link disable, or link down) that only resets the secondary bus's configuration space. Writing a 1 clears this bit. This bit is sticky.
27	SWDS_LINK_RESET. Read-write. Reset: 0. 0=Not Detected. 1=Detected. (Switch Downstream only) Indicates if there is a request to perform a link reset (hot reset, link disable, or link down) that resets the secondary bus. Writing a 1 clears this bit. This bit is sticky.
26	SWUS_LINK_RESET_PHY_CALIB. Read-write. Reset: 0. 0=Not Detected. 1=Detected. (Switch Upstream only) Indicates if there is a request to perform a link reset (hot reset, link disable, or link down) that also resets the Port's PCS and PHY. Writing a 1 clears this bit. This bit is sticky.
25	SWUS_LINK_RESET_CFG_ONLY. Read-write. Reset: 0. 0=Not Detected. 1=Detected. (Switch Upstream only) Indicates if there is a request to perform a link reset (hot reset, link disable, or link down) that only resets the Port's configuration space. Writing a 1 clears this bit. This bit is sticky.
24	SWUS_LINK_RESET. Read-write. Reset: 0. 0=Not Detected. 1=Detected. (Switch Upstream only) Indicates if there is a request to perform a link reset (hot reset, link disable, or link down). Writing a 1 clears this bit. This bit is sticky.
23:19	Reserved.
18	PERST_ASRT. Read-write. Reset: 0. 0=Normal Operation. 1=Assert PERST signal. If supported, forces the reset signal to be asserted.
17	WAIT_STATE. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the reset cycle is in the wait state (able to download efuses).
16	RESET_COMPLETE. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the reset cycle is complete.
15:2	Reserved.
1	ATOMIC_RESET. Read-write. Reset: 0. 0=Normal Operation. 1=Reset. When ATOMIC_RESET_EN bit is 1, forces an atomic reset event, when a 1 is written. When the atomic reset is complete, hardware automatically clears this bit.
0	RECONFIGURE. Read-write. Reset: 0. 0=Normal Operation. 1=Reconfigure. When RECONFIGURE_EN bit is 1, forces a reconfiguration event, when a 1 is written. When the reconfiguration is complete, hardware automatically clears this bit.

NBIO0PCICORE0x00000428...NBIO1PCICORE4x00000428 (PCIECORE::SWRST_CONTROL_6)

Bits	Description
31:24	PRIV_SURP_DIS_VEC. Read-write. Reset: 26h. Description: Masks Surprise Down detection during the specified conditions. Bit 0 - when PME_TURN_OFF was sent. Bit 1 - when PME_TURN_OFF/PME_TO_ACK handshake did not complete. Bit 2 - when Hot-Plug Capable=1 and Hot-Plug Surprise=1. Bit 3 - when Hot-Plug Capable=1 and Power Controller Control=1 (off). Bit 4 - when DPC is triggered. Bit 5 - when Presence Detect State=1 (present). Bit 6 - Reserved. Bit 7 - Reserved.
23	AER_PRIV_MASK_CORR_INT_ERR. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls completely masking CORR_INT error (error status bit will not be set). This bit is sticky.
22	AER_PRIV_MASK_REPLAY_TIMER_TIMEOUT. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls completely masking REPLAY_TIMER_TIMEOUT error (error status bit will not be set). This bit is sticky.
21	AER_PRIV_MASK_INTERNAL_ERR. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls completely masking internal UNCORRECTABLE and internal CORRECTABLE error (error status bit will not be set). This bit is sticky.
20	AER_PRIV_MASK_BAD_TLP. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls completely masking BAD_TLP error (error status bit will not be set). This bit is sticky.
19	AER_PRIV_MASK_BAD_DLLP. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls completely masking BAD_DLLP error (error status bit will not be set). This bit is sticky.
18	STRAP_POISONED_ADVISORY_NONFATAL. Read-write. 0=Poisoned TLP Received is not Advisory Non-Fatal. 1=Poisoned TLP Received is Advisory Non-Fatal. Controls the error logging method. Provides an override for STRAP_POISONED_ADVISORY_NONFATAL.
17	SEND_ERR_MSG_IMMEDIATELY. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if allowed to send fatal/non-fatal error messages immediately instead of delaying until first error is logged. This bit is sticky.
16	CI_SLV_BUF_HALT_RESET. Write-only. Reset: 0. 0=Normal Operation. 1=Reset. Triggers a reset of the read-out halt state of both posted and non-posted slave buffers.
15	CI_NP_SLV_BUF_RD_HALT_STATUS. Read-only. 0=Not Detected. 1=Detected. Indicates non-posted slave buffer read-out halt status.
14	CI_P_SLV_BUF_RD_HALT_STATUS. Read-only. 0=Not Detected. 1=Detected. Indicates posted slave buffer read-out halt status.
13	AER_PRIV_MASK_REPLAY_NUM_ROLLOVER. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls completely masking REPLAY_NUM_ROLLOVER error (error status bit will not be set). This bit is sticky.
12	AER_PRIV_MASK_RCV_ERR. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls completely masking RCV error (error status bit will not be set). This bit is sticky.
11	AER_HDR_LOG_F0_TIMER_EXPIRED. Read-write. 0=Not Detected. 1=Detected. Indicates if AER function 0 first error log timer has expired.

10:8	AER_HDR_LOG_TIMEOUT. Read-write. Reset: 5h. Controls the AER first error log timeout. ValidValues:																		
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>Disabled</td></tr> <tr> <td>1h</td><td>67 ms</td></tr> <tr> <td>2h</td><td>134 ms</td></tr> <tr> <td>3h</td><td>268 ms</td></tr> <tr> <td>4h</td><td>537 ms</td></tr> <tr> <td>5h</td><td>1 s</td></tr> <tr> <td>6h</td><td>2 s</td></tr> <tr> <td>7h</td><td>4 s</td></tr> </table>	Value	Description	0h	Disabled	1h	67 ms	2h	134 ms	3h	268 ms	4h	537 ms	5h	1 s	6h	2 s	7h	4 s
Value	Description																		
0h	Disabled																		
1h	67 ms																		
2h	134 ms																		
3h	268 ms																		
4h	537 ms																		
5h	1 s																		
6h	2 s																		
7h	4 s																		
7	RX_GENERATE_ECRC_ERR. Write-only. 0=Disable. 1=Enable. Controls if ECRC error is generated for the next received TLP.																		
6	RX_GENERATE_POIS_TLP. Write-only. 0=Disable. 1=Enable. A write of 1 to this register causes the next received TLP with Data to be poisoned.																		
5	RX_GENERATE_LCRC_ERR. Write-only. 0=Disable. 1=Enable. Controls if LCRC error is generated for the next received TLP.																		
4:3	Reserved.																		
2	RX_DROP_ECRC_FAILURES. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if received ECRC errors are dropped.																		
1	STRAP_FIRST_RCVD_ERR_LOG. Read-write. 0=First Detected Error Logging. 1=First Received Error Logging. Controls the error logging method. Provides an override for STRAP_FIRST_RCVD_ERR_LOG.																		
0	ERR_REPORTING_DIS. Read-write. 0=Enable. 1=Disable. Controls PCIe Advanced Error Reporting.

Bits	Description
31:12	Reserved.
11	LC_SPEED_NEG_UNSUCCESSFUL. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if speed negotiation did not result in new Link speed due to a mismatch in data rate identifiers.
10	LC_LINK_BW_NOTIFICATION_DETECT_MODE. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if Link Bandwidth Management for speed changes in Detect, results in updating LINK_BW_MANAGEMENT_STATUS.
9	LC_LW_CHANGE_FAILED. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link width change was initiated but the width was not changed.
8	LC_LW_CHANGE_OTHER. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link width changed and the change was initiated by the Link partner.
7	LC_SHORT_LW_CHANGE. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link width was changed due to a short dynamic link width reconfiguration.
6	LC_LONG_LW_CHANGE. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link width was changed due to a long dynamic link width reconfiguration.
5	LC_FAILED_SPEED_NEG. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link speed change failed and link speed was reverted to initial speed.
4	LC_RELIABILITY_SPEED_CHANGE. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link speed changed due to a reliability issue at the previous speed.
3	LC_OTHER_INIT_SPEED_CHANGE. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link speed changed due to a speed negotiation initiated by the Link partner.
2	LC_SW_INIT_SPEED_CHANGE. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link speed changed due to a software initiated speed negotiation.
1	LC_HW_INIT_SPEED_CHANGE. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if Link speed changed due to a hardware initiated speed negotiation.
0	LC_BW_CHANGE_INT_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if the Port generates an interrupt when the link bandwidth changes.

Bits	Description																		
31:29	LC_HOLD_TRAINING_MODE. Read-write. Reset: 2h. Controls the method to put lanes in power saving mode when hold_training mode is asserted. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>Do not power down lanes when in hold training</td></tr> <tr> <td>1h</td><td>Power down lanes by asserting TxElecIdle/TxCompliance</td></tr> <tr> <td>2h</td><td>Set PowerDown to P2</td></tr> <tr> <td>3h</td><td>Reserved.</td></tr> <tr> <td>4h</td><td>Set PowerDown to Power State 4</td></tr> <tr> <td>5h</td><td>Set PowerDown to Power State 5</td></tr> <tr> <td>6h</td><td>Set PowerDown to Power State 6</td></tr> <tr> <td>7h</td><td>Set PowerDown to Power State 7</td></tr> </table>	Value	Description	0h	Do not power down lanes when in hold training	1h	Power down lanes by asserting TxElecIdle/TxCompliance	2h	Set PowerDown to P2	3h	Reserved.	4h	Set PowerDown to Power State 4	5h	Set PowerDown to Power State 5	6h	Set PowerDown to Power State 6	7h	Set PowerDown to Power State 7
Value	Description																		
0h	Do not power down lanes when in hold training																		
1h	Power down lanes by asserting TxElecIdle/TxCompliance																		
2h	Set PowerDown to P2																		
3h	Reserved.																		
4h	Set PowerDown to Power State 4																		
5h	Set PowerDown to Power State 5																		
6h	Set PowerDown to Power State 6																		
7h	Set PowerDown to Power State 7																		
28	LC_WAIT_IN_DETECT. Read-write. Reset: 0. 0=Normal Operation. 1=Remain in Detect. Forces LTSSM to remain in Detect and transition lanes to the power state indicated by LC_HOLD_TRAINING_MODE field.																		
27	LC_ACCEPT_ALL_PRESETS_TEST. Read-write. Reset: 0. 0=Reject. 1=Accept. Controls P0, P2, P7, P8, P10 acceptance in Polling, Compliance and Loopback when PHY is operating in reduced swing mode.																		
26	LC_ACCEPT_ALL_PRESETS. Read-write. Reset: 0. 0=Reject. 1=Accept. Controls P0, P2, P7, P8, P10 acceptance during Link Equalization when PHY is operating in reduced swing mode.																		
25	LC_TX_SWING_OVERRIDE. Read-write. 0=Supports full swing and reduced swing. 1=Supports only full swing. Set to indicate if only full swing transmitter voltage level is supported by the PHY.																		
24	LC_DSC_EQ_FS_LF_INVALID_TO_PRESETS. Read-write. Reset: 0. 0=Disable. 1=Enable. (Upstream Ports only) Controls if Link Equalization search algorithm is forced to Preset Search when the Upstream Port receives illegal FS and/or LF values from Link partner.																		
23:22	LC_SAFE_RECOVER_CNTL. Read-write. Reset: 0h. Controls the Safe Recover feature. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>Disabled</td></tr> <tr> <td>1h</td><td>Enabled</td></tr> <tr> <td>2h</td><td>Performed before and after a link speed change</td></tr> <tr> <td>3h</td><td>Verbose Mode</td></tr> </table>	Value	Description	0h	Disabled	1h	Enabled	2h	Performed before and after a link speed change	3h	Verbose Mode								
Value	Description																		
0h	Disabled																		
1h	Enabled																		
2h	Performed before and after a link speed change																		
3h	Verbose Mode																		
21	LC_LOCAL_USE_PRESET. Read-only. 0=Not Detected. 1=Detected. Captures if the near-end transmitter is using a preset at the data rate specified by LC_LOCAL_EQ_SETTINGS_RATE, for the lane selected by PCIE_LC_DEBUG_CNTL.DEBUG_LANE_EN.																		
20:16	LC_LOCAL_POST_CURSOR. Read-only. Captures the Post-Cursor used for the near-end transmitter at the data rate specified by LC_LOCAL_EQ_SETTINGS_RATE, for the lane selected by PCIE_LC_DEBUG_CNTL.DEBUG_LANE_EN.																		

15:10	LC_LOCAL_CURSOR. Read-only. Captures the Cursor used for the near-end transmitter at the data rate specified by LC_LOCAL_EQ_SETTINGS_RATE, for the lane selected by PCIE_LC_DEBUG_CNTL.DEBUG_LANE_EN.										
9:6	LC_LOCAL_PRE_CURSOR. Read-only. Captures the Pre-Cursor used for the near-end transmitter at the data rate specified by LC_LOCAL_EQ_SETTINGS_RATE, for the lane selected by PCIE_LC_DEBUG_CNTL.DEBUG_LANE_EN.										
5:2	LC_LOCAL_PRESET. Read-only. Captures the Preset used for the near-end transmitter at the data rate specified by LC_LOCAL_EQ_SETTINGS_RATE, for the lane selected by PCIE_LC_DEBUG_CNTL.DEBUG_LANE_EN.										
1:0	LC_LOCAL_EQ_SETTINGS_RATE. Read-write. Reset: 0h. Controls the data rate for the LC_LOCAL_PRESET, LC_LOCAL_PRE_CURSOR, LC_LOCAL_CURSOR, and LC_LOCAL_POST_CURSOR field values, as well as the data rate for the PCIE_LC_BEST_EQ_SETTINGS register field values ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>8.0 GT/s</td></tr> <tr> <td>1h</td><td>16.0 GT/s</td></tr> <tr> <td>2h</td><td>32.0 GT/s</td></tr> <tr> <td>3h</td><td>Reserved.</td></tr> </table>	Value	Description	0h	8.0 GT/s	1h	16.0 GT/s	2h	32.0 GT/s	3h	Reserved.
Value	Description										
0h	8.0 GT/s										
1h	16.0 GT/s

Bits	Description
15:11	Reserved.
10	INT_DIS . Read-write. Reset: 0. 0=Enable. 1=Disable. Controls the ability of a function to generate INTx interrupt Messages.
9	FAST_B2B_EN . Read-only. Reset: Fixed,0. Does not apply to PCI Express.
8	SERR_EN . Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to signal upstream, Non-fatal and Fatal errors detected by the function, and the ability of a Port to forward upstream, Non-fatal and Fatal signals received by the Port's secondary interface.
7	AD_STEPPING . Read-only. Reset: Fixed,0. Does not apply to PCI Express.
6	PARITY_ERROR_RESPONSE . Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to log errors in the Master Data Parity Error bit of the Status register.
5	PAL_SNOOP_EN . Read-only. Reset: Fixed,0. Does not apply to PCI Express.
4	MEM_WRITE_INVALIDATE_EN . Read-only. Reset: Fixed,0. Does not apply to PCI Express.
3	SPECIAL_CYCLE_EN . Read-only. Reset: Fixed,0. Does not apply to PCI Express.
2	BUS_MASTER_EN . Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to issue Memory and I/O Read/Write Requests, and the ability of a Port to forward Memory and I/O Read/Write Requests in the upstream direction.
1	MEM_ACCESS_EN . Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to accept Memory Space accesses.
0	IO_ACCESS_EN . Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to accept I/O Space accesses.

Bits	Description
15	PARITY_ERROR_DETECTED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a function receives a poisoned TLP on the primary interface.
14	SIGNALED_SYSTEM_ERROR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. For a function with its SERR Enable bit in the Command register set, indicates if the function signals a Non-fatal or Fatal error on the primary interface.
13	RECEIVED_MASTER_ABORT. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a Requester receives a Completion with Unsupported Request Completion Status on the primary interface.
12	RECEIVED_TARGET_ABORT. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a Requester receives a Completion with Completer Abort Completion Status on the primary interface.
11	SIGNAL_TARGET_ABORT. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a function completes a Request using Completer Abort Completion Status on the primary interface.
10:9	DEVSEL_TIMING. Read-only. Reset: Fixed,0h. Does not apply to PCI Express.
8	MASTER_DATA_PARITY_ERROR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Description: For a Requester with its Parity Error Response bit in the Command register set, indicates if either of the following two conditions occurs on the primary interface: 1) Requester receives a poisoned Completion 2) Requester transmits a poisoned Request. For a Port with its Parity Error Response bit in the Command register set, indicates if either of the following two conditions occurs on the primary interface: 1) Port receives a poisoned Completion going downstream 2) Port transmits a poisoned Request upstream.
7	FAST_BACK_CAPABLE. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
6	Reserved.
5	PCI_66_CAP. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
4	CAP_LIST. Read-only. Reset: Fixed,1. 0=Not Supported. 1=Supported. Indicates the presence of a capability list item.
3	INT_STATUS. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if an INTx interrupt Message is pending internally in the function.
2:1	Reserved.
0	IMMEDIATE_READINESS. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates if the function is able to successfully complete valid configuration cycles at any time following any type of reset.

BXXD0[1F1...2F1]x008 (PCIERCCFG::REVISION_ID)

Read-only. Reset: 00h.

Indicates a device specific revision identifier.

Reset: Fixed,00h. Does not apply to PCI Express.**23:16** **SUB_BUS_NUM.** Read-write. Reset: 00h. Records the bus number of the highest numbered bus segment which is behind the bridge.**15:8** **SECONDARY_BUS.** Read-write. Reset: 00h. Records the bus number of the bus segment to which the secondary interface of the bridge is connected.**7:0** **PRIMARY_BUS.** Read-write. Reset: 00h. Records the bus number of the bus segment to which the primary interface of the bridge is connected.

BXXD0[1F1...2F1]x01C (PCIERCCFG::IO_BASE_LIMIT)

Defines an I/O address range which is used by the bridge to determine when to forward I/O transactions from one interface to the other. For 32-bit addressing type, combines with I/O Base Upper 16 Bits and I/O Limit Upper 16 Bits registers.

Bits	Description
15	PARITY_ERROR_DETECTED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a function receives a poisoned TLP on the secondary interface.
14	RECEIVED_SYSTEM_ERROR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the function receives a Non-fatal or Fatal error Message on the secondary interface.
13	RECEIVED_MASTER_ABORT. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a Requester receives a Completion with Unsupported Request Completion Status on the secondary interface.
12	RECEIVED_TARGET_ABORT. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a Requester receives a Completion with Completer Abort Completion Status on the secondary interface.
11	SIGNAL_TARGET_ABORT. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a function completes a Request using Completer Abort Completion Status on the secondary interface.
10:9	DEVSEL_TIMING. Read-only. Reset: Fixed,0h. Does not apply to PCI Express.
8	MASTER_DATA_PARITY_ERROR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Description: For a Port with its Parity Error Response Enable bit in the Bridge Control register set, indicates if either of the following two conditions occurs on the secondary interface: 1) Port receives a poisoned Completion coming upstream 2) Port transmits a poisoned Request downstream.
7	FAST_BACK_CAPABLE. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
6	Reserved.
5	PCI_66_CAP. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
4:0	Reserved.

BXXD0[1F1...2F1]x020 (PCIERCCFG::MEM_BASE_LIMIT)

Defines a non-prefetchable memory address range which is used by the bridge to determine when to forward memory transactions from one interface to the other.

Bits	Description
15:12	Reserved.
11	DISCARD_TIMER_SERR_ENABLE. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
10	DISCARD_TIMER_STATUS. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
9	SECONDARY_DISCARD_TIMER. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
8	PRIMARY_DISCARD_TIMER. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
7	FAST_B2B_EN. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
6	SECONDARY_BUS_RESET. Read-write. Reset: 0. 0=Normal Operation. 1=Reset. Triggers a hot reset on the corresponding Port.
5	MASTER_ABORT_MODE. Read-only. Reset: Fixed,0. Does not apply to PCI Express.
4	VGA_DEC. Read-write. Reset: 0. 0=Disable. 1=Enable. For a Port with VGA Enable set, enables the bridge to provide 16-bit decoding of VGA I/O addresses, rather than 10-bit decoding.
3	VGA_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the bridge's ability to forward VGA compatible addresses from primary interface to secondary interface.
2	ISA_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Disables the bridge from forwarding I/O addresses, in the top 768 bytes of each 1 kB block in the I/O address range, from primary interface to secondary interface.
1	SERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the forwarding of ERR_COR, ERR_NONFATAL and ERR_FATAL from secondary interface to primary interface.
0	PARITY_RESPONSE_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls the ability of a function to log errors in the Master Data Parity Error bit of the Secondary Status register.

BXXD0[1F1...2F1]x040 (PCIERCCFG::EXT_BRIDGE_CNTL)

Read-write. Reset: 00h.

External Bridge Control register.

Bits	Description																		
15:11	PME_SUPPORT. Read-only. Reset: 19h. Indicates the power states from which the function may generate a PME. This field is a bit vector that covers all Dx states. Bit 0 corresponds to D0.																		
10	D2_SUPPORT. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates support for the D2 power state.																		
9	D1_SUPPORT. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates support for the D1 power state.																		
8:6	AUX_CURRENT. Read-write. Indicates the amount of 3.3Vaux current required to support PME from D3cold. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>0 mA</td></tr> <tr> <td>1h</td><td>55 mA</td></tr> <tr> <td>2h</td><td>100 mA</td></tr> <tr> <td>3h</td><td>160 mA</td></tr> <tr> <td>4h</td><td>220 mA</td></tr> <tr> <td>5h</td><td>270 mA</td></tr> <tr> <td>6h</td><td>320 mA</td></tr> <tr> <td>7h</td><td>375 mA</td></tr> </table>	Value	Description	0h	0 mA	1h	55 mA	2h	100 mA	3h	160 mA	4h	220 mA	5h	270 mA	6h	320 mA	7h	375 mA
Value	Description																		
0h	0 mA																		
1h	55 mA																		
2h	100 mA																		
3h	160 mA																		
4h	220 mA																		
5h	270 mA																		
6h	320 mA																		
7h	375 mA																		
5	DEV_SPECIFIC_INIT. Read-only. Reset: Fixed,0. 0=Not Required. 1=Required. Indicates if the function requires a Device Specific Initialization sequence, upon transition to D0.																		
4	IMMEDIATE_READINESS_ON_RETURN_TO_D0. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates if the function is able to successfully complete valid configuration cycles at any time following return to D0.																		
3	PME_CLOCK. Read-only. Reset: Fixed,0. Does not apply to PCI Express.																		
2:0	VERSION. Read-only. Reset: Fixed,3h. Indicates PCI-SIG defined capability structure version number.																		

BXXD0[1F1...2F1]x054 (PCIERCCFG::PMI_STATUS_CNTL)

Power Management Status/Control register.

Bits	Description
31:24	PMI_DATA. Read-only. Reset: Fixed,00h. Data.
23	BUS_PWR_EN. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if Secondary Bus Clock Control is supported.
22	B2_B3_SUPPORT. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if Secondary Bus Power Control is supported.
21:16	Reserved.
15	PME_STATUS. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if a PME is pending internally in the function. When auxiliary power is consumed, this field is sticky.
14:13	DATA_SCALE. Read-only. Reset: Fixed,0h. Data Scale.
12:9	DATA_SELECT. Read-only. Reset: Fixed,0h. Data Select.
8	PME_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls a function's ability to generate a PME. When auxiliary power is consumed, this field is sticky.
7:4	Reserved.
3	NO_SOFT_RESET. Read-only. Reset: 0. 0=Reset on D3hot to D0. 1=No Reset on D3hot to D0. Indicates if the function does not reset on a transition from D3hot to D0.
2	Reserved.
1:0	POWER_STATE. Read-write. Reset: 0h. Writes set the function to the written power state. Reads return the function's current power state.
ValidValues:	
Value	Description
0h	D0
1h	D1
2h	D2
3h	D3

Bits	Description
------	-------------

15:14	Reserved.
-------	-----------

13:9	INT_MESSAGE_NUM. Read-only. Reset: Fixed,00h. Indicates the MSI/MSI-X vector used for interrupts generated in association with any of the status bits in the PCI Express capability structure.
------	---

8	SLOT_IMPLEMENTED. Read-write. 0=Not Supported. 1=Supported.
---	--

	Description: (Downstream Ports only) Indicates if the Link associated with this Port is connected to a slot. For Upstream Ports, this bit is undefined.
--	--

7:4	DEVICE_TYPE. Read-only. Reset: 4h. Indicates the type of PCI Express device.
-----	---

ValidValues:	
---------------------	--

Value	Description
0h	PCI Express Endpoint
1h	Legacy PCI Express Endpoint
3h-2h	Reserved.
4h	Root Port of PCI Express Root Complex
5h	Upstream Port of PCI Express Switch
6h	Downstream Port of PCI Express Switch
7h	PCI Express to PCI/PCI-X Bridge
8h	PCI/PCI-X to PCI Express Bridge
9h	Root Complex Integrated Endpoint
Ah	Root Complex Event Collector
Fh-Bh	Reserved.

3:0	VERSION. Read-only. Reset: 2h. Indicates PCI-SIG defined capability structure version number.
-----	--

Bits	Description										
31:29	Reserved.										
28	FLR_CAPABLE. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Description: (Endpoints only) Indicates if the function supports Function Level Resets. For non-Endpoints this field is Reserved.										
27:26	CAPTURED_SLOT_POWER_SCALE. Read-only. Reset: 0h. (Upstream Ports only) Indicates the scale used for the Slot Power Limit Value. ValidValues:										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>1.0x</td></tr> <tr> <td>1h</td><td>0.1x</td></tr> <tr> <td>2h</td><td>0.01x</td></tr> <tr> <td>3h</td><td>0.001x</td></tr> </table>	Value	Description	0h	1.0x	1h	0.1x	2h	0.01x	3h	0.001x
Value	Description										
0h	1.0x										
1h	0.1x										
2h	0.01x										
3h	0.001x										
25:18	CAPTURED_SLOT_POWER_LIMIT. Read-only. Reset: 00h. (Upstream Ports only) In combination with the Slot Power Limit Scale value, indicates the upper limit on power supplied by slot.										
17	Reserved.										
16	ERR_COR_SUBCLASS_CAPABLE. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates if the function supports the ERR_COR Subclass field in ERR_COR messages.										
15	ROLE_BASED_ERR_REPORTING. Read-only. Reset: 1. 0=Not Supported. 1=Supported. Indicates the function implements Role-Based Error Reporting functionality.										
14:12	Reserved.										
11:9	L1_ACCEPTABLE_LATENCY. Read-write. Reset: Fixed,0h. For non-Endpoints this field is Reserved.										
8:6	L0S_ACCEPTABLE_LATENCY. Read-write. Reset: Fixed,0h. For non-Endpoints this field is Reserved.										
5	EXTENDED_TAG. Read-only. Reset: Fixed,1. 0=5-Bit Tag Supported. 1=8-Bit Tag Supported. When 10-Bit Tag Requester Supported bit is clear, indicates the maximum supported size of the Tag field as a Requester.										
4:3	PHANTOM_FUNC. Read-only. Reset: Fixed,0h. Indicates the support for use of unclaimed function numbers to extend the number of outstanding transactions allowed by logically combining unclaimed function numbers with the Tag identifier. ValidValues:										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>No Phantom Functions</td></tr> <tr> <td>1h</td><td>1 Phantom Function</td></tr> <tr> <td>2h</td><td>3 Phantom Functions</td></tr> <tr> <td>3h</td><td>7 Phantom Functions</td></tr> </table>	Value	Description	0h	No Phantom Functions	1h	1 Phantom Function	2h	3 Phantom Functions	3h	7 Phantom Functions
Value	Description										
0h	No Phantom Functions										
1h	1 Phantom Function										
2h	3 Phantom Functions										
3h	7 Phantom Functions										
2:0	MAX_PAYLOAD_SUPPORT. Read-only. Reset: 2h. Indicates the maximum payload size that the function can support for TLPs.										

	ValidValues:	
	Value	Description
	0h	128 Bytes
	1h	256 Bytes
	2h	512 Bytes
	3h	1024 Bytes
	4h	2048 Bytes
	5h	4096 Bytes
	7h-6h	Reserved.

Bits	Description																
15	BRIDGE_CFG_RETRY_EN. Read-write. Reset: Fixed,0. 0=Disable. 1=Enable. Description: (Bridges only) Controls if a PCI Express to PCI/PCI-X Bridge is permitted to return Configuration Retry Status. (Endpoints only) A write of 1 to this bit initiates Function Level Reset to the function. Reads always return 0. For non-Bridges and non-Endpoints this bit is Reserved.																
14:12	MAX_READ_REQUEST_SIZE. Read-write. Reset: 2h. Controls the maximum Read Request size for the function as a Requester. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>128 Bytes</td></tr> <tr> <td>1h</td><td>256 Bytes</td></tr> <tr> <td>2h</td><td>512 Bytes</td></tr> <tr> <td>3h</td><td>1024 Bytes</td></tr> <tr> <td>4h</td><td>2048 Bytes</td></tr> <tr> <td>5h</td><td>4096 Bytes</td></tr> <tr> <td>7h-6h</td><td>Reserved.</td></tr> </table>	Value	Description	0h	128 Bytes	1h	256 Bytes	2h	512 Bytes	3h	1024 Bytes	4h	2048 Bytes	5h	4096 Bytes	7h-6h	Reserved.
Value	Description																
0h	128 Bytes																
1h	256 Bytes																
2h	512 Bytes																
3h	1024 Bytes																
4h	2048 Bytes																
5h	4096 Bytes																
7h-6h	Reserved.																
11	NO_SNOOP_EN. Read-write. Reset: 1. 0=Disable. 1=Enable. Controls if the function is permitted to set the No Snoop bit in the Requester Attributes of transactions it initiates that do not require hardware enforced cache coherency.																
10	AUX_POWER_PM_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. Controls if a function is permitted to draw AUX power independent of PME AUX power.																
9	PHANTOM_FUNC_EN. Read-only. Reset: Fixed,0. 0=Disable. 1=Enable. When 10-Bit Tag Requester Enable bit is clear, controls if a function is permitted to use unclaimed function numbers as Phantom Functions to extend the number of outstanding transaction identifiers.																
8	EXTENDED_TAG_EN. Read-write. Reset: 1. 0=Disable. 1=Enable. When 10-Bit Tag Requester Enable bit is clear, controls if a function is permitted to use an 8-bit Tag field as a Requester. When both bits are disabled the function is restricted to use a 5-bit Tag field.																
7:5	MAX_PAYLOAD_SIZE. Read-write. Reset: 0h. Controls the maximum TLP payload size for the function.																

Valid Values:	
Value	Description
0h	128 Bytes
1h	256 Bytes
2h	512 Bytes
3h	1024 Bytes
4h	2048 Bytes
5h	4096 Bytes
7h-6h	Reserved.

4	RELAXED_ORD_EN. Read-write. Reset: 1. 0=Disable. 1=Enable. Controls if the function is permitted to set the Relaxed Ordering bit in the Attributes field of transactions it initiates that do not require strong write ordering.
3	USR_REPORT_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of Unsupported Requests.
2	FATAL_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of Fatal errors.
1	NON_FATAL_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of Non-fatal errors.
0	CORR_ERR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls signaling of correctable errors.

Bits	Description
15:7	Reserved.
6	EMER_POWER_REDUCTION_DETECTED. Read-write. Reset: Fixed,0. 0=Not Detected. 1=Detected. Description: (Upstream Ports only) When Emergency Power Reduction Supported field is 1 or 2, indicates if the function has entered the Emergency Power Reduction state. For Downstream Ports, this bit is Reserved.
5	TRANSACTIONS_PEND. Read-only. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the function has issued Non-Posted Requests, on its own behalf, which have not been completed.
4	AUX_PWR. Read-write. 0=Not Detected. 1=Detected. Functions that require AUX power report this bit as set if AUX power is detected by the function.
3	USR_DETECTED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates if the function received an Unsupported Request.
2	FATAL_ERR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates status of Fatal errors detected.
1	NON_FATAL_ERR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates status of Non-fatal errors detected.
0	CORR_ERR. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. Indicates status of correctable errors detected.

Bits	Description																		
31:24	PORT_NUMBER. Read-only. Reset: 00h. Indicates the Port number for the Link.																		
23	Reserved.																		
22	ASPM_OPTIONALITY_COMPLIANCE. Read-write. Reset: Fixed,1. 0=Not Supported. 1=Supported. Indicates if the Port supports the ASPM Optionality functionality.																		
21	LINK_BW_NOTIFICATION_CAP. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Description: (Downstream Ports only) Indicates if the Port supports the Link Bandwidth Notification status and interrupt mechanisms. For Upstream Ports, this bit is Reserved.																		
20	DL_ACTIVE_REPORTING_CAPABLE. Read-only. 0=Not Supported. 1=Supported. Description: (Downstream Ports only) Indicates if the Port supports the reporting of DL_Active state of the Data Link Control and Management State Machine. For Upstream Ports, this bit is Reserved.																		
19	SURPRISE_DOWN_ERR_REPORTING. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Description: (Downstream Ports only) Indicates if the Port supports the detecting and reporting of a Surprise Down error condition. For Upstream Ports, this bit is Reserved.																		
18	CLOCK_POWER_MANAGEMENT. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Description: (Upstream Ports only) Indicates if the Port tolerates removal of REFCLK via the CLKREQ# mechanism when the Link is in L1 or L2/L3 Ready. For Downstream Ports, this bit is Reserved.																		
17:15	L1_EXIT_LATENCY. Read-only. Reset: 2h. Indicates the L1 exit latency for the Link. The value reported indicates the length of time this Port requires to complete transition from L1 to L0. ValidValues:																		
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>up to 999 ns</td></tr> <tr> <td>1h</td><td>1 to 1.9 us</td></tr> <tr> <td>2h</td><td>2 to 3.9 us</td></tr> <tr> <td>3h</td><td>4 to 7.9 us</td></tr> <tr> <td>4h</td><td>8 to 15.9 us</td></tr> <tr> <td>5h</td><td>16 to 31.9 us</td></tr> <tr> <td>6h</td><td>32 to 64 us</td></tr> <tr> <td>7h</td><td>more than 64 us</td></tr> </table>	Value	Description	0h	up to 999 ns	1h	1 to 1.9 us	2h	2 to 3.9 us	3h	4 to 7.9 us	4h	8 to 15.9 us	5h	16 to 31.9 us	6h	32 to 64 us	7h	more than 64 us
Value	Description																		
0h	up to 999 ns																		
1h	1 to 1.9 us																		
2h	2 to 3.9 us																		
3h	4 to 7.9 us																		
4h	8 to 15.9 us																		
5h	16 to 31.9 us																		
6h	32 to 64 us																		
7h	more than 64 us																		
14:12	L0S_EXIT_LATENCY. Read-only. Reset: 1h. Indicates the L0s exit latency for the Link. The value reported indicates the length of time this Port requires to complete transition from L0s to L0.																		

	ValidValues:	
	Value	Description
	0h	up to 63 ns
	1h	64 to 127 ns
	2h	128 to 255 ns
	3h	256 to 511 ns
	4h	512 to 999 ns
	5h	1 to 1.9 us
	6h	2 to 4 us
	7h	more than 4 us
11:10	PM_SUPPORT. Read-only. Reset: Fixed,2h. Indicates the level of ASPM supported on the Link. L0s is NOT supported even though this register field keeps the default value of 3. BIOS must use PM_SUPPORT values of either 0(No ASPM Supported) or 2(L1 Supported) when programming PCIe ports.	
	ValidValues:	
	Value	Description
	0h	No ASPM Supported
	1h	L0s Supported
	2h	L1 Supported
	3h	L0s and L1 Supported
9:4	LINK_WIDTH. Read-only. Reset: 00h. Indicates the maximum width of the Link.	
	ValidValues:	
	Value	Description
	00h	Reset
	01h	x1
	02h	x2
	03h	Reserved.
	04h	x4
	07h-05h	Reserved.
	08h	x8
	0Bh-09h	Reserved.
	0Ch	x12
	0Fh-0Dh	Reserved.
	10h	x16
	1Fh-11h	Reserved.
	20h	x32
	3Fh-21h	Reserved.
3:0	LINK_SPEED. Read-only. Reset: 5h. Indicates the maximum speed of the Link.	
	ValidValues:	
	Value	Description
	0h	Link inactive
	1h	2.5 GT/s
	2h	5.0 GT/s
	3h	8.0 GT/s
	4h	16.0 GT/s
	5h	32.0 GT/s
	Fh-6h	Reserved.

Bits	Description
------	-------------

15:14	DRS_SIGNALING_CONTROL. Read-write. Reset: 0h.
-------	--

Description: (Downstream Ports only) When DRS Supported bit is set, controls the mechanism used to report reception of a DRS Message.

For Upstream Ports, this field is Reserved.

ValidValues:

Value	Description
0h	DRS not Reported
1h	DRS Interrupt Enabled
2h	DRS to FRS Signaling Enabled
3h	Reserved.

13:12	Reserved.
-------	-----------

11	LINK_AUTONOMOUS_BW_INT_EN. Read-write. Reset: 0. 0=Disable. 1=Enable.
----	--

Description: (Downstream Ports only) Controls if the function generates an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been set.

For Upstream Ports, this bit is Reserved.

10	LINK_BW_MANAGEMENT_INT_EN. Read-write. Reset: 0. 0=Disable. 1=Enable.
----	--

Description: (Downstream Ports only) Controls if the function generates an interrupt to indicate that the Link Bandwidth Management Status bit has been set.

For Upstream Ports, this bit is Reserved.

9	HW_AUTONOMOUS_WIDTH_DISABLE. Read-write. Reset: 0. 0=Enable. 1=Disable. Controls the Port's ability to autonomously direct changes in link width.
---	--

8	CLOCK_POWER_MANAGEMENT_EN. Read-write. Reset: 0. 0=Disable. 1=Enable.
---	--

Description: (Upstream Ports only) Controls if the function is permitted to use CLKREQ# signal to power manage the Link clock.

For Downstream Ports, this bit is Reserved.

7	EXTENDED_SYNC. Read-write. Reset: 0. 0=Disable. 1=Enable. Forces the transmission of additional ordered sets, exiting the L0s or Recovery states.
---	--

6	COMMON_CLOCK_CFG. Read-write. Reset: 0. 0=Same REFCLK not Used. 1=Same REFCLK Used. Indicates if this component and the component at the opposite end of this Link are operating with a distributed common reference clock.
---	--

5	RETRAIN_LINK. Write-only. Reset: 0. 0=Normal Operation. 1=Retrain Link.
---	--

Description: (Downstream Ports only) A write of 1 to this bit initiates Link retraining by directing the Physical Layer LTSSM to the Recovery state. Reads always return 0.

For Upstream Ports, this bit is Reserved.

4	LINK_DIS. Read-write. Reset: 0. 0=Normal Operation. 1=Disable Link.
---	--

	Description: (Downstream Ports only) Disables the Link when set to 1, by directing the Physical Layer LTSSM to the Disabled state. For Upstream Ports, this bit is Reserved.										
3	READ_CPL_BOUNDARY. Read-write. Reset: Fixed,0. 0=64 Byte. 1=128 Byte. Description: Indicates the RCB value for the Root Port sourcing the topology associated with the Link. For Switches, this bit is Reserved.										
2	PTM_PROP_DELAY_ADAPT_INTER_B. Read-write. Reset: Fixed,0. 0=Interpretation A. 1=Interpretation B. Controls the interpretation of the Propagation Delay[31:0] field of the PTM Message. For devices that don't support PTM, this bit is Reserved.										
1:0	PM_CONTROL. Read-write. Reset: 0h. Controls the level of ASPM enabled on the Link. ValidValues:										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>Disabled</td></tr> <tr> <td>1h</td><td>Tx_L0s Entry Enabled</td></tr> <tr> <td>2h</td><td>L1 Entry Enabled</td></tr> <tr> <td>3h</td><td>Tx_L0s and L1 Entry Enabled</td></tr> </table>	Value	Description	0h	Disabled	1h	Tx_L0s Entry Enabled	2h	L1 Entry Enabled	3h	Tx_L0s and L1 Entry Enabled
Value	Description										
0h	Disabled										
1h	Tx_L0s Entry Enabled										
2h	L1 Entry Enabled										
3h	Tx_L0s and L1 Entry Enabled

Bits	Description
15	LINK_AUTONOMOUS_BW_STATUS. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates that hardware has autonomously changed the Link's speed or width, without the Port transitioning through DL_Down status, for reasons other than to attempt to correct unreliable Link operation.
14	LINK_BW_MANAGEMENT_STATUS. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Description: Indicates that either of the following has occurred without the Port transitioning through DL_Down status: A Link retraining has completed following a write of 1 to the Retrain Link bit. Hardware has changed the Link's speed or width to attempt to correct unreliable Link operation, either through an LTSSM timeout or a higher level process.
13	DL_ACTIVE. Read-only. 0=Not DL_Active state. 1=DL_Active state. If Data Link Layer Link Active Capability is supported and when the optionally supported SFI DLL State Mask bit is clear, indicates the status of the Data Link Control and Management State Machine.
12	SLOT_CLOCK_CFG. Read-write. Reset: Fixed,1. 0=Same REFCLK not Required. 1=Same REFCLK Required. Indicates if the component uses the same physical reference clock that the platform provides on the connector.
11	LINK_TRAINING. Read-only. Reset: 0. 0=Normal. 1=Link Training in Progress. Description: (Downstream Ports only) Indicates that Link training is in progress (Physical Layer LTSSM in Configuration or Recovery state) or that 1 was written to the Retrain Link bit but Link training has not yet begun. Hardware clears this bit once Link training is complete. For Upstream Ports, this bit is Reserved.
10	Reserved.
9:4	NEGOTIATED_LINK_WIDTH. Read-only. Indicates the negotiated width of the Link.

	ValidValues:	
	Value	Description
	00h	Link inactive
	01h	x1
	02h	x2
	03h	Reserved.
	04h	x4
	07h-05h	Reserved.
	08h	x8
	0Bh-09h	Reserved.
	0Ch	x12
	0Fh-0Dh	Reserved.
	10h	x16
	1Fh-11h	Reserved.
	20h	x32
	3Fh-21h	Reserved.
3:0	CURRENT_LINK_SPEED. Read-only. Reset: 1h. Indicates the negotiated speed of the Link.	
	ValidValues:	
	Value	Description
	0h	Link inactive
	1h	2.5 GT/s
	2h	5.0 GT/s
	3h	8.0 GT/s
	4h	16.0 GT/s
	5h	32.0 GT/s
	Fh-6h	Reserved.

BXXD0[1F1...2F1]x06C (PCIERCCFG::SLOT_CAP)

Read-write.

The Slot Capabilities register identifies slot specific capabilities.

`_func[6:0]_instPCIE0_nbio0_aliasHOST; BXXD01F[7:1]x06C; BXX=IOHC::NB_BUS_NUM_CNTL_nbio0_aliasSMN[NB_BUS_NUM]``_func[6:0]_instPCIE0_nbio1_aliasHOST; BXXD01F[7:1]x06C; BXX=IOHC::NB_BUS_NUM_CNTL_nbio1_aliasSMN[NB_BUS_NUM]``_func7_instPCIE3_nbio0_aliasHOST; BXXD02F1x06C; BXX=IOHC::NB_BUS_NUM_CNTL_nbio0_aliasSMN[NB_BUS_NUM]``_func7_instPCIE3_nbio1_aliasHOST; BXXD02F1x06C; BXX=IOHC::NB_BUS_NUM_CNTL_nbio1_aliasSMN[NB_BUS_NUM]``_func[8:0]_instPCIE0_nbio0_aliasSMN; NBIO0PCIECORE0P[8:0]CFGx0000006C; NBIO0PCIECORE0P[8:0]CFG=1A30_[8:0]000h``_func[8:0]_instPCIE1_nbio0_aliasSMN; NBIO0PCIECORE1P[8:0]CFGx0000006C; NBIO0PCIECORE1P[8:0]CFG=1A70_[8:0]000h``_func[8:0]_instPCIE2_nbio0_aliasSMN; NBIO0PCIECORE2P[8:0]CFGx0000006C; NBIO0PCIECORE2P[8:0]CFG=1A80_[8:0]000h``_func[8:0]_instPCIE3_nbio0_aliasSMN; NBIO0PCIECORE3P[8:0]CFGx0000006C; NBIO0PCIECORE3P[8:0]CFG=1A40_[8:0]000h``_func[3:0]_instPCIE4_nbio0_aliasSMN; NBIO0PCIECORE4P[3:0]CFGx0000006C; NBIO0PCIECORE4P[3:0]CFG=1AB0_[3:0]000h``_func[8:0]_instPCIE0_nbio1_aliasSMN; NBIO1PCIECORE0P[8:0]CFGx0000006C; NBIO1PCIECORE0P[8:0]CFG=1A50_[8:0]000h``_func[8:0]_instPCIE1_nbio1_aliasSMN; NBIO1PCIECORE1P[8:0]CFGx0000006C; NBIO1PCIECORE1P[8:0]CFG=1A90_[8:0]000h``_func[8:0]_instPCIE2_nbio1_aliasSMN; NBIO1PCIECORE2P[8:0]CFGx0000006C; NBIO1PCIECORE2P[8:0]CFG=1AA0_[8:0]000h``_func[8:0]_instPCIE3_nbio1_aliasSMN; NBIO1PCIECORE3P[8:0]CFGx0000006C; NBIO1PCIECORE3P[8:0]CFG=1A60_[8:0]000h``_func[3:0]_instPCIE4_nbio1_aliasSMN; NBIO1PCIECORE4P[3:0]CFGx0000006C; NBIO1PCIECORE4P[3:0]CFG=1AD0_[3:0]000h`

Bits	Description										
31:19	PHYSICAL_SLOT_NUM. Read-write. Reset: 0000h. Indicates the physical slot number attached to this Port.										
18	NO_COMMAND_COMPLETED_SUPPORTED. Read-write. 0=Not Supported. 1=Supported. Indicates if this slot does not generate software notification when an issued command is completed by the Hot-Plug Controller.										
17	ELECTROMECH_INTERLOCK_PRESENT. Read-write. 0=Not Supported. 1=Supported. Indicates if an Electromechanical Interlock is implemented for this slot.										
16:15	SLOT_PWR_LIMIT_SCALE. Read-write. Indicates the scale used for the Slot Power Limit Value. ValidValues:										
	<table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>1.0x</td></tr> <tr> <td>1h</td><td>0.1x</td></tr> <tr> <td>2h</td><td>0.01x</td></tr> <tr> <td>3h</td><td>0.001x</td></tr> </table>	Value	Description	0h	1.0x	1h	0.1x	2h	0.01x	3h	0.001x
Value	Description										
0h	1.0x										
1h	0.1x										
2h	0.01x										
3h	0.001x										
14:7	SLOT_PWR_LIMIT_VALUE. Read-write. In combination with the Slot Power Limit Scale value, indicates the upper limit on power supplied by this slot.										
6	HOTPLUG_CAPABLE. Read-write. 0=Not Supported. 1=Supported. Indicates if this slot is capable of supporting Hot-Plug operations.										
5	HOTPLUG_SURPRISE. Read-write. 0=Not Supported. 1=Supported. Indicates if an adapter present in this slot might be removed from the system without any prior notification.										
4	PWR_INDICATOR_PRESENT. Read-write. Reset: 0. 0=Not Supported. 1=Supported. Indicates if a Power Indicator is implemented for this slot.										
3	ATTN_INDICATOR_PRESENT. Read-write. Reset: 0. 0=Not Supported. 1=Supported. Indicates if an Attention Indicator is implemented for this slot.										
2	MRL_SENSOR_PRESENT. Read-write. Reset: 0. 0=Not Supported. 1=Supported. Indicates if a Manually-operated Retention Latch Sensor is implemented for this slot.										
1	PWR_CONTROLLER_PRESENT. Read-write. Reset: 0. 0=Not Supported. 1=Supported. Indicates if a Power Controller is implemented for this slot.										
0	ATTN_BUTTON_PRESENT. Read-write. Reset: 0. 0=Not Supported. 1=Supported. Indicates if an Attention Button is implemented for this slot.										

BXXD0[1F1...2F1]x070 (PCIERCCFG::SLOT_CNTL)

Read-write. Reset: 0000h.

The Slot Control register controls slot specific parameters.

`_func[6:0]_instPCIE0_nbio0_aliasHOST; BXXD01F[7:1]x070; BXX=IOHC::NB_BUS_NUM_CNTL_nbio0_aliasSMN[NB_BUS_NUM]``_func[6:0]_instPCIE0_nbio1_aliasHOST; BXXD01F[7:1]x070; BXX=IOHC::NB_BUS_NUM_CNTL_nbio1_aliasSMN[NB_BUS_NUM]``_func7_instPCIE3_nbio0_aliasHOST; BXXD02F1x070; BXX=IOHC::NB_BUS_NUM_CNTL_nbio0_aliasSMN[NB_BUS_NUM]``_func7_instPCIE3_nbio1_aliasHOST; BXXD02F1x070; BXX=IOHC::NB_BUS_NUM_CNTL_nbio1_aliasSMN[NB_BUS_NUM]``_func[8:0]_instPCIE0_nbio0_aliasSMN; NBIO0PCIECORE0P[8:0]CFGx00000070; NBIO0PCIECORE0P[8:0]CFG=1A30_[8:0]000h``_func[8:0]_instPCIE1_nbio0_aliasSMN; NBIO0PCIECORE1P[8:0]CFGx00000070; NBIO0PCIECORE1P[8:0]CFG=1A70_[8:0]000h``_func[8:0]_instPCIE2_nbio0_aliasSMN; NBIO0PCIECORE2P[8:0]CFGx00000070; NBIO0PCIECORE2P[8:0]CFG=1A80_[8:0]000h``_func[8:0]_instPCIE3_nbio0_aliasSMN; NBIO0PCIECORE3P[8:0]CFGx00000070; NBIO0PCIECORE3P[8:0]CFG=1A40_[8:0]000h``_func[3:0]_instPCIE4_nbio0_aliasSMN; NBIO0PCIECORE4P[3:0]CFGx00000070; NBIO0PCIECORE4P[3:0]CFG=1AB0_[3:0]000h``_func[8:0]_instPCIE0_nbio1_aliasSMN; NBIO1PCIECORE0P[8:0]CFGx00000070; NBIO1PCIECORE0P[8:0]CFG=1A50_[8:0]000h``_func[8:0]_instPCIE1_nbio1_aliasSMN; NBIO1PCIECORE1P[8:0]CFGx00000070; NBIO1PCIECORE1P[8:0]CFG=1A90_[8:0]000h``_func[8:0]_instPCIE2_nbio1_aliasSMN; NBIO1PCIECORE2P[8:0]CFGx00000070; NBIO1PCIECORE2P[8:0]CFG=1AA0_[8:0]000h``_func[8:0]_instPCIE3_nbio1_aliasSMN; NBIO1PCIECORE3P[8:0]CFGx00000070; NBIO1PCIECORE3P[8:0]CFG=1A60_[8:0]000h``_func[3:0]_instPCIE4_nbio1_aliasSMN; NBIO1PCIECORE4P[3:0]CFGx00000070; NBIO1PCIECORE4P[3:0]CFG=1AD0_[3:0]000h`

Bits	Description										
15	Reserved.										
14	INBAND_PD_DISABLE . Read-write. Reset: 0. 0=Enable. 1=Disable. If In-band Presence Detect Disable Capability is supported, controls the Port's ability to use in-band presence to determine Presence Detect State and Component Presence.										
13	AUTO_SLOT_PWR_LIMIT_DISABLE . Read-write. Reset: 0. 0=Enable. 1=Disable. (Downstream Ports only) Controls the Port's ability of automatically sending a Set Slot Power Limit Message when a Link transitions from non-DL_Up to DL_Up status.										
12	DL_STATE_CHANGED_EN . Read-write. Reset: 0. 0=Disable. 1=Enable. If Data Link Layer Link Active Capability is supported, controls if the function generates software notification when the Data Link Layer Link Active bit is changed.										
11	ELECTROMECH_INTERLOCK_CNTL . Read-write. Reset: 0. If Electromechanical Interlock is supported, writes of 1 causes the state of the Electromechanical Interlock to toggle. Writes of 0 have no effect. Reads always return 0.										
10	PWR_CONTROLLER_CNTL . Read-write. Reset: 0. 0=Power On. 1=Power Off. If Power Controller is supported, writes set the power state of the slot to the written state. Read returns the last written value.										
9:8	PWR_INDICATOR_CNTL . Read-write. Reset: 0h. If Power Indicator is supported, writes set the Power Indicator to the written state. Reads return the last written value. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>Reset</td></tr> <tr> <td>1h</td><td>On</td></tr> <tr> <td>2h</td><td>Blink</td></tr> <tr> <td>3h</td><td>Off</td></tr> </table>	Value	Description	0h	Reset	1h	On	2h	Blink	3h	Off
Value	Description										
0h	Reset										
1h	On										
2h	Blink										
3h	Off										
7:6	ATTN_INDICATOR_CNTL . Read-write. Reset: 0h. If Attention Indicator is supported, writes set the Attention Indicator to the written state. Reads return the last written value. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>Reset</td></tr> <tr> <td>1h</td><td>On</td></tr> <tr> <td>2h</td><td>Blink</td></tr> <tr> <td>3h</td><td>Off</td></tr> </table>	Value	Description	0h	Reset	1h	On	2h	Blink	3h	Off
Value	Description										
0h	Reset										
1h	On										
2h	Blink										
3h	Off										
5	HOTPLUG_INTR_EN . Read-write. Reset: 0. 0=Disable. 1=Enable. If Hot-Plug Capability is supported, controls if the function generates an interrupt on enabled Hot-Plug events.										

4	COMMAND_COMPLETED_INTR_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. If Command Completed notification is supported, controls if the function generates software notification when a command is completed by the Hot-Plug Controller.
3	PRESENCE_DETECT_CHANGED_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. If Hot-Plug Capability is supported, controls if the function generates software notification on a presence detect changed event.
2	MRL_SENSOR_CHANGED_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. If MRL Sensor is supported, controls if the function generates software notification on a MRL sensor changed event.
1	PWR_FAULT_DETECTED_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. If Power Fault Detection is supported, controls if the function generates software notification on a power fault event.
0	ATTN_BUTTON_PRESSED_EN. Read-write. Reset: 0. 0=Disable. 1=Enable. If Attention Button is supported, controls if the function generates software notification on an attention button pressed event.

BXXD0[1F1...2F1]x072 (PCIERCCFG::SLOT_STATUS)

Reset: 0000h.

The Slot Status register provides information about slot specific parameters.

_func[6:0]_instPCIE0_nbio0_aliasHOST; BXXD01F[7:1]x072; BXX=IOHC::NB_BUS_NUM_CNTL_nbio0_aliasSMN[NB_BUS_NUM]_func[6:0]_instPCIE0_nbio1_aliasHOST; BXXD01F[7:1]x072; BXX=IOHC::NB_BUS_NUM_CNTL_nbio1_aliasSMN[NB_BUS_NUM]_func7_instPCIE3_nbio0_aliasHOST; BXXD02F1x072; BXX=IOHC::NB_BUS_NUM_CNTL_nbio0_aliasSMN[NB_BUS_NUM]_func7_instPCIE3_nbio1_aliasHOST; BXXD02F1x072; BXX=IOHC::NB_BUS_NUM_CNTL_nbio1_aliasSMN[NB_BUS_NUM]_func[8:0]_instPCIE0_nbio0_aliasSMN; NBIO0PCIECORE0P[8:0]CFGx00000072; NBIO0PCIECORE0P[8:0]CFG=1A30_[8:0]000h_func[8:0]_instPCIE1_nbio0_aliasSMN; NBIO0PCIECORE1P[8:0]CFGx00000072; NBIO0PCIECORE1P[8:0]CFG=1A70_[8:0]000h_func[8:0]_instPCIE2_nbio0_aliasSMN; NBIO0PCIECORE2P[8:0]CFGx00000072; NBIO0PCIECORE2P[8:0]CFG=1A80_[8:0]000h_func[8:0]_instPCIE3_nbio0_aliasSMN; NBIO0PCIECORE3P[8:0]CFGx00000072; NBIO0PCIECORE3P[8:0]CFG=1A40_[8:0]000h_func[3:0]_instPCIE4_nbio0_aliasSMN; NBIO0PCIECORE4P[3:0]CFGx00000072; NBIO0PCIECORE4P[3:0]CFG=1AB0_[3:0]000h_func[8:0]_instPCIE0_nbio1_aliasSMN; NBIO1PCIECORE0P[8:0]CFGx00000072; NBIO1PCIECORE0P[8:0]CFG=1A50_[8:0]000h_func[8:0]_instPCIE1_nbio1_aliasSMN; NBIO1PCIECORE1P[8:0]CFGx00000072; NBIO1PCIECORE1P[8:0]CFG=1A90_[8:0]000h_func[8:0]_instPCIE2_nbio1_aliasSMN; NBIO1PCIECORE2P[8:0]CFGx00000072; NBIO1PCIECORE2P[8:0]CFG=1AA0_[8:0]000h_func[8:0]_instPCIE3_nbio1_aliasSMN; NBIO1PCIECORE3P[8:0]CFGx00000072; NBIO1PCIECORE3P[8:0]CFG=1A60_[8:0]000h_func[3:0]_instPCIE4_nbio1_aliasSMN; NBIO1PCIECORE4P[3:0]CFGx00000072; NBIO1PCIECORE4P[3:0]CFG=1AD0_[3:0]000h

Bits	Description
15:9	Reserved.
8	DL_STATE_CHANGED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. If Data Link Layer Link Active Capability is supported, indicates if the value reported in the Data Link Layer Link Active bit of the Link Status register is changed.
7	ELECTROMECH_INTERLOCK_STATUS. Read-only. Reset: 0. 0=Electromechanical Interlock Disengaged. 1=Electromechanical Interlock Engaged. If Electromechanical Interlock is supported, indicates the status of the Electromechanical Interlock.
6	PRESENCE_DETECT_STATE. Read-only. Reset: 0. 0=Adapter not Present. 1=Adapter Present. When the optionally supported SFI PD State Mask bit is clear, indicates the presence of an adapter in the slot, based on all enabled presence detect mechanisms.
5	MRL_SENSOR_STATE. Read-only. Reset: 0. 0=MRL Closed. 1=MRL Open. If MRL Sensor is supported, indicates the status of the MRL sensor.
4	COMMAND_COMPLETED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. If Command Completed notification is supported, indicates if the Hot-Plug Controller completes an issued command.
3	PRESENCE_DETECT_CHANGED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. If Hot-Plug Capability is supported, indicates if the value reported in the Presence Detect State bit is changed.
2	MRL_SENSOR_CHANGED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. If MRL Sensor is supported, indicates if a MRL sensor state change is detected.
1	PWR_FAULT_DETECTED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. If Power Fault Detection is supported, indicates if the power controller detected a power fault at this slot.
0	ATTN_BUTTON_PRESSED. Read,Write-1-to-clear. Reset: 0. 0=Not Detected. 1=Detected. If Attention Button is supported, indicates if the attention button is pressed.

BXXD0[1F1...2F1]x074 (PCIERCCFG::ROOT_CNTL)

Read-write. Reset: 0000h.

The Root Control register controls Root Complex specific parameters.

3h	3 E-E TLP Prefixes Supported										
21	END_END_TLP_PREFIX_SUPPORTED. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates if the function supports receiving End-End TLP Prefixes.										
20	EXTENDED_FMT_FIELD_SUPPORTED. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates if the function supports the 3-bit definition of the Fmt field. When not set, the function supports only the 2-bit definition of the Fmt field.										
19:18	OBFF_SUPPORTED. Read-only. Reset: 0h. Indicates if the function supports Optimized Buffer Flush/Fill signaling.										

	ValidValues:	
	Value	Description
	0h	OBFF not Supported
	1h	OBFF using Message Supported
	2h	OBFF using WAKE# Supported
	3h	OBFF using WAKE# and Message Supported
17	TEN_BIT_TAG_REQUESTER_SUPPORTED. Read-only. 0=Use Extended Tag Field Supported. 1=10-Bit Tag Supported. Indicates the maximum supported size of the Tag field as a Requester.	
16	TEN_BIT_TAG_COMPLETER_SUPPORTED. Read-only. 0=8-Bit Tag Supported. 1=10-Bit Tag Supported. Indicates the maximum supported size of the Tag field as a Completer.	
15:14	LN_SYSTEM_CLS. Read-only. Reset: Fixed,0h. For Root Ports, indicates if the Root Port supports LN protocol as an LN Completer.	
	ValidValues:	
	Value	Description
	0h	LN Completer not Supported
	1h	LN Completer with 64 byte cachelines
	2h	LN Completer with 128 byte cachelines
	3h	Reserved.
13:12	TPH_CPLR_SUPPORTED. Read-only. For Root Ports and Endpoints, indicates if the Completer supports TPH or Extended TPH. For all other functions, this field is Reserved.	
	ValidValues:	
	Value	Description
	0h	TPH and Extended TPH Completer not Supported
	1h	TPH Completer Supported and Extended TPH Completer not Supported
	2h	Reserved.
	3h	TPH and Extended TPH Completer Supported
11	LTR_SUPPORTED. Read-only. Reset: 0. 0=Not Supported. 1=Supported. Indicates if the function supports the Latency Tolerance Reporting mechanism.	
10	NO_RO_ENABLED_P2P_PASSING. Read-only. 0=Not Supported. 1=Supported. Description: (Downstream Ports or Switch Upstream Ports only) Indicates if a routing element supports never allowing posted requests with Relaxed Ordering attribute bit set, to pass each other. For Endpoints, this bit is Reserved.	
9	CAS128_CMPLT_SUPPORTED. Read-only. Reset: Fixed,0. 0=Not Supported. 1=Supported. Indicates if a function supports being a 128-bit AtomicOp completer.	
8	ATOMICOP_64CMPLT_SUPPORTED. Read-only. 0=Not Supported. 1=Supported. Indicates if a function supports being a 64-bit AtomicOp completer.	
7	ATOMICOP_32CMPLT_SUPPORTED. Read-only. 0=Not Supported. 1=Supported. Indicates if a function supports being a 32-bit AtomicOp completer.	
6	ATOMICOP_ROUTING_SUPPORTED. Read-only. 0=Not Supported. 1=Supported. Description: (Downstream Ports or Switch Upstream Ports only) Indicates if a Port supports AtomicOp routing. For Endpoints, this bit is Reserved.	
5	ARI_FORWARDING_SUPPORTED. Read-only. 0=Not Supported. 1=Supported. Description: (Downstream Ports only) Indicates if a Port supports ARI forwarding. For Upstream Ports, this bit is Reserved.	
4	CPL_TIMEOUT_DIS_SUPPORTED. Read-only. 0=Not Supported. 1=Supported. Indicates if a Requester supports the Completion Timeout disable mechanism. For functions that don't issue requests, this field is Reserved.	
3:0	CPL_TIMEOUT_RANGE_SUPPORTED. Read-only. Indicates if a Requester supports the Completion Timeout programmability mechanism. For functions that don't issue requests, this field is Reserved.	

	ValidValues:	
	Value	Description
	0h	Fixed
	1h	Range A Supported
	2h	Range B Supported
	3h	Ranges A & B Supported
	5h-4h	Reserved.
	6h	Ranges B & C Supported
	7h	Ranges A & B & C Supported
	Dh-8h	Reserved.
	Eh	Ranges B & C & D Supported
	Fh	Ranges A & B & C & D Supported

Bits	Description										
15	END_END_TLP_PREFIX_BLOCKING. Read-write. Reset: 0. 0=Disable. 1=Enable. Description: (Downstream Ports or Switch Upstream Ports only) Controls the ability of a Port to block TLPs containing End-End TLP Prefixes that target going out of this Egress Port. For Endpoints, this bit is Reserved.										
14:13	OBFF_EN. Read-write. Reset: 0h. Controls if the function is permitted to use Optimized Buffer Flush/Fill signaling. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>Disable</td></tr> <tr> <td>1h</td><td>Enable OBFF Message A</td></tr> <tr> <td>2h</td><td>Enable OBFF Message B</td></tr> <tr> <td>3h</td><td>Enable OBFF WAKE#</td></tr> </table>	Value	Description	0h	Disable	1h	Enable OBFF Message A	2h	Enable OBFF Message B	3h	Enable OBFF WAKE#
Value	Description										
0h	Disable										
1h	Enable OBFF Message A										
2h	Enable OBFF Message B										
3h	Enable OBFF WAKE#										
12	TEN_BIT_TAG_REQUESTER_ENABLE. Read-write. Reset: 0. 0=Disable. 1=Enable. Controls if a function is permitted to use a 10-bit Tag field as a Requester. When disabled the function uses the setting in the Extended Tag Field Enable bit.										
11	EMER_POWER_REDUCTION_REQUEST. Read-write. Reset: Fixed,0. 0=Normal Operation. 1=Enter Emergency Power Reduction state. Description: (Upstream Ports only) Triggers the function to enter the Emergency Power Reduction state. For Downstream Ports, this bit is Reserved.										
10	LTR_EN. Read-write. 0=Disable. 1=Enable. Controls if the Port is permitted to use the Latency Tolerance Reporting mechanism.										
9	IDO_COMPLETION_ENABLE. Read-write. 0=Disable. 1=Enable. Controls if the function is permitted to set the IDO bit in the Attributes field of completions it returns.										
8	IDO_REQUEST_ENABLE. Read-write. 0=Disable. 1=Enable. Controls if the function is permitted to set the IDO bit in the Attributes field of requests it initiates.										
7	ATOMICOP_EGRESS_BLOCKING. Read-write. 0=Disable. 1=Enable. Description: (Downstream Ports or Switch Upstream Ports only) Controls the ability of a Port to block AtomicOps that target going out of this Egress Port. For Endpoints, this bit is Reserved.										
6	ATOMICOP_REQUEST_EN. Read-write. 0=Disable. 1=Enable. Controls the ability of a function to initiate AtomicOp requests.										
5	ARI_FORWARDING_EN. Read-write. 0=Disable. 1=Enable. Description: (Downstream Ports only) Controls the ability of a Port to allow Configuration requests for Device Numbers greater than 0, when converting from a Type 1 Configuration cycle to a Type 0 Configuration cycle. For Upstream Ports, this bit is Reserved.										

4	CPL_TIMEOUT_DIS. Read-write. 0=Enable. 1=Disable. Controls the ability of a function to use the completion timeout mechanism.																												
3:0	CPL_TIMEOUT_VALUE. Read-write. Controls the completion timeout value for the function. ValidValues: <table> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0h</td><td>50 us to 50 ms (Fixed)</td></tr> <tr> <td>1h</td><td>50 to 100 us (Range A only)</td></tr> <tr> <td>2h</td><td>1 to 10 ms (Range A only)</td></tr> <tr> <td>4h-3h</td><td>Reserved.</td></tr> <tr> <td>5h</td><td>16 to 55 ms (Range B only)</td></tr> <tr> <td>6h</td><td>65 to 210 ms (Range B only)</td></tr> <tr> <td>8h-7h</td><td>Reserved.</td></tr> <tr> <td>9h</td><td>260 to 900 ms (Range C only)</td></tr> <tr> <td>Ah</td><td>1 to 3.5 s (Range C only)</td></tr> <tr> <td>Ch-Bh</td><td>Reserved.</td></tr> <tr> <td>Dh</td><td>4 to 13 s (Range D only)</td></tr> <tr> <td>Eh</td><td>17 to 64 s (Range D only)</td></tr> <tr> <td>Fh</td><td>Reserved.</td></tr> </table>	Value	Description	0h	50 us to 50 ms (Fixed)	1h	50 to 100 us (Range A only)	2h	1 to 10 ms (Range A only)	4h-3h	Reserved.	5h	16 to 55 ms (Range B only)	6h	65 to 210 ms (Range B only)	8h-7h	Reserved.	9h	260 to 900 ms (Range C only)	Ah	1 to 3.5 s (Range C only)	Ch-Bh	Reserved. Reset: 0h.**Description:** At 5.0 [GT/s](#) only, when using Enter Compliance bit, this field controls the Port's transmitter de-emphasis level in compliance mode.

At 8.0 GT/s or higher only, when using Enter Compliance bit, this field controls the Port's transmitter Preset setting in compliance mode. This field is sticky.

ValidValues:

Value	Description
0h	DeEmph -6.0 dB, Preshoot 0.0 dB (8.0 GT/s or higher) or -6.0 dB (5.0 GT/s)
1h	DeEmph -3.5 dB, Preshoot 0.0 dB (8.0 GT/s or higher) or -3.5 dB (5.0 GT/s)
2h	DeEmph -4.4 dB, Preshoot 0.0 dB
3h	DeEmph -2.5 dB, Preshoot 0.0 dB
4h	DeEmph -0.0 dB, Preshoot 0.0 dB
5h	DeEmph -0.0 dB, Preshoot 1.9 dB
6h	DeEmph -0.0 dB, Preshoot 2.5 dB
7h	DeEmph -6.0 dB, Preshoot 3.5 dB
8h	DeEmph -3.5 dB, Preshoot 3.5 dB
9h	DeEmph -0.0 dB, Preshoot 3.5 dB
Ah	DeEmph variable, Preshoot 0.0 dB
Fh-Bh	Reserved.

11 COMPLIANCE_SOS. Read-write. Reset: 0. 0=Disable. 1=Enable. At 5.0 [GT/s](#) or lower only, controls if the Port's transmitter inserts SKP ordered sets when sending either compliance pattern. This bit is sticky.**10 ENTER_MOD_COMPLIANCE.** Read-write. Reset: 0. 0=Compliance Pattern. 1=Modified Compliance Pattern. Controls which compliance pattern the Port transmits, when Enter Compliance bit is used to enter compliance mode. This bit is sticky.**9:7 XMIT_MARGIN.** Read-write. Reset: 0h. Controls the value of the non-deemphasized voltage level at the Port's transmitter pins. This field is sticky.**6 SELECTABLE_DEEMPHASIS.** Read-only. Reset: 0. 0=-6.0 dB. 1=-3.5 dB. (Downstream Ports only) At 5.0 [GT/s](#) only, controls the Port's transmitter de-emphasis level.**5 HW_AUTONOMOUS_SPEED_DISABLE.** Read-write. Reset: 0. 0=Enable. 1=Disable. Controls the Port's ability to autonomously direct changes in link speed. This bit is sticky.**4 ENTER_COMPLIANCE.** Read-write. Reset: 0. 0=Normal Operation. 1=Enter Compliance. Forces a Port to enter compliance mode, when it receives a hot reset. This bit is sticky, but for Upstream Ports only is cleared if the link state goes to Detect.

3:0	TARGET_LINK_SPEED. Read-write. Reset: 5h. (Downstream Ports only) Controls the upper limit on the Link operational speed by restricting the data rate values advertised by the upstream component. When using Enter Compliance bit, this field controls the Port's target compliance mode speed. This field is sticky.	
	ValidValues:	
	Value	Description
	0h	Link inactive

Bits	Description																
15	DRS_MESSAGE_RECEIVED. Read-write. Reset: 0. 0=Not Detected. 1=Detected. Description: (Downstream Ports only) When DRS Supported bit is set and When the optionally supported SFI DRS Mask bit is clear, indicates if the Port has received a DRS Message. For Upstream Ports, this bit is Reserved.																
14:12	DOWNSTREAM_COMPONENT_PRESENCE. Read-only. Reset: 0h. Description: (Downstream Ports only) When DRS Supported bit is set, this field indicates the presence and DRS state of the downstream component (if any). For Upstream Ports, this bit is Reserved. ValidValues: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>Link Down, Presence not Determined</td> </tr> <tr> <td>1h</td> <td>Link Down, Component not Present</td> </tr> <tr> <td>2h</td> <td>Link Down, Component Present and Data Link Layer not Active</td> </tr> <tr> <td>3h</td> <td>Reserved.</td> </tr> <tr> <td>4h</td> <td>Link Up, Component Present and DRS Message not Received</td> </tr> <tr> <td>5h</td> <td>Link Up, Component Present and DRS Message Received</td> </tr> <tr> <td>7h-6h</td> <td>Reserved.</td> </tr> </tbody> </table>	Value	Description	0h	Link Down, Presence not Determined	1h	Link Down, Component not Present	2h	Link Down, Component Present and Data Link Layer not Active	3h	Reserved.	4h	Link Up, Component Present and DRS Message not Received	5h	Link Up, Component Present and DRS Message Received	7h-6h	Reserved.
Value	Description																
0h	Link Down, Presence not Determined																
1h	Link Down, Component not Present																
2h	Link Down, Component Present and Data Link Layer not Active																
3h	Reserved.																
4h	Link Up, Component Present and DRS Message not Received																
5h	Link Up, Component Present and DRS Message Received																
7h-6h	Reserved.																
11:10	Reserved.																
9:8	CROSSLINK_RESOLUTION. Read-only. Reset: Fixed,0h. Indicates the state of the Port's crosslink negotiation (if supported). ValidValues: <table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>No Information</td> </tr> <tr> <td>1h</td> <td>Completed as Upstream Port</td> </tr> <tr> <td>2h</td> <td>Completed as Downstream Port</td> </tr> <tr> <td>3h</td> <td>In Progress</td> </tr> </tbody> </table>	Value	Description	0h	No Information	1h	Completed as Upstream Port	2h	Completed as Downstream Port	3h	In Progress						
Value	Description																
0h	No Information																
1h	Completed as Upstream Port																
2h	Completed as Downstream Port																
3h	In Progress																
7	RTM2_PRESENCE_DET. Read-only. 0=Not Detected. 1=Detected. When Two Retimers Presence Detect Supported bit is set, indicates if the Port detected two Retimers in the most recent link negotiation. This bit is sticky.																
6	RTM1_PRESENCE_DET. Read-only. 0=Not Detected. 1=Detected. When Retimer Presence Detect Supported bit is set, indicates if the Port detected a Retimer in the most recent link negotiation. This bit is sticky.																
5	LINK_EQUALIZATION_REQUEST_8GT. Read,Write-1-to-clear. 0=Not Detected. 1=Detected. Indicates if hardware requests 8.0 GT/s link equalization to be performed. This bit is sticky.																
4	EQUALIZATION_PHASE3_SUCCESS_8GT. Read-only. 0=Not Detected. 1=Detected. Indicates if Phase 3 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed. This bit is sticky.																

3	EQUALIZATION_PHASE2_SUCCESS_8GT . Read-only. 0=Not Detected. 1=Detected. Indicates if Phase 2 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed. This bit is sticky.
2	EQUALIZATION_PHASE1_SUCCESS_8GT . Read-only. 0=Not Detected. 1=Detected. Indicates if Phase 1 of the 8.0 GT/s Transmitter Equalization procedure has successfully completed. This bit is sticky.
1	EQUALIZATION_COMPLETE_8GT . Read-only. 0=Not Detected. 1=Detected. Indicates if the 8.0 GT/s Transmitter Equalization procedure has completed. This bit is sticky.
0	CUR_DEEMPHASIS_LEVEL . Read-only. 0=-6.0 dB. 1=-3.5 dB. At 5.0 GT/s only, indicates the Port's transmitter de-emphasis level.

BXXD0[1F1...2F1]x08C (PCIERCCFG::SLOT_CAP2)

Read-write. Reset: 0000_0000h.

The Slot Capabilities 2 register identifies slot specific capabilities.

Bits Description15:8 **NEXT_PTR**. Read-only. Reset: Fixed,00h. Pointer to the next item in the capabilities list, or 00h if no other items exist.7:0 **CAP_ID**. Read-only. Reset: Fixed,08h. A PCI-SIG defined ID number that indicates the nature and format of the capability.

BXXD0[1F1...2F1]x0CA (PCIERCCFG::MSI_MAP_CAP)

Read-only. Reset: Fixed,A803h.

MSI Mapping Capability register.

Bits Description15:11 **CAP_TYPE.** Read-only. Reset: Fixed,15h. Indicates this as the MSI Mapping Capability block.

10:2 Reserved.

1 **FIXD.** Read-only. Reset: Fixed,1. 0=Not Supported. 1=Supported. Indicates if the function supports a fixed MSI mapping at 0xFEExxxxx.0 **EN.** Read-only. Reset: Fixed,1. 0=Disable. 1=Enable. Controls if the MSI mapping is active.**BXXD0[1F1...2F1]x100 (PCIERCCFG::PCIE_VENDOR_SPECIFIC_ENH_CAP_LIST)**

Read-only.

Vendor-Specific Extended Capability header.
